8. Does anybody remember this amp

Newsgroup: rec.radio.cb
Date: 2000-02-01 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <20000131211817.23291.00000150@ng-cr1.aol.com>
Source record: 22627

In 1968 I had been into CB about a year when I visited a military surplus store in Albany GA. There I found an amp that used 8 811As in the final, no other stages. Didn't have to do anything to it except replace a couple of broken tubes. Thing cost me about $25 +$5 more for a set of tubes. Took about 30 or 40 watts to drive it and put out nearly 2KW dead key. Does anyone remember what the military designation on this amp was as I am trying to find one like it.

These radio do talk very well, I consider them "the poor man's Galaxy". (Although they are really no comparison, they still do a good job for the money and the features they give you.) They can be easily adjusted and modified to key quite a bit. I don't suggest peaking them very highly unless you change the final to a 2SC1969. Additional heatsinking should also be used. I have seen many of them set up to key about 7 to 8 watts with "swing" up to 35 or 40. They are the same unit as the Mongoose 450. The radio was made to easily accept the "connex" echo board. The fine and course delta tune become the echo controls after installation etc. Nice inexpensive alternative to obtaining additional channels and power without paying much more than the price of a stock Cobra 29 or Uniden PC76.

As far as liking the radio? I sell quite a few of these and the Galaxy / Mirage / RCI stuff.
I like em all. They all have their problems and their good points. Advantages and Disadvantages.

The best radio is the one that you think is the best. That said, the Grant XL gets my vote. If I were running previously-enjoyed, I would opt for the President Grant, TRC-449 or Cobra 138GTL.

Mind you, I like my signals on the SSB.

From: MC 10kW Jesus <qsl27@hotmail.com>
Message-ID: <38966576.43BCC63D@hotmail.com>
Source record: 22643

The noise you are describing is coming in on the power leads. You have to ask yourself, how is it getting there? Well, I start by attaching the radio directly to the battery. There is no lower impedance source for the radio - period. Ideally I use a battery that has two sets of terminals and use the unused one for the radio. There are two ways for noise to get on the line. The first way is from a high-current accessory that is drawing irregular current. The worst culprit is probably the electric radiator fan. I've never had a radio/vechicle combination that was so bad that clean battery terminals and a good battery didn't resolve the problem. If I did, I would probably install an LC filter on the power lead near the radio. I would use an old transformer and an electrolytic capacitor bypassed with a much lower value polypropylene. The second way the noise can get in is by being induced onto the line from other electrical devices in the car. Such as spark plugs and ignition amplifier leads running parallel with the CB power leads. The solution here is to run them as far away as possible. I usually snake the power leads between metal body panels here. It is impossible to induce currents (and noise) only the power leads if they are within the body panels. Failing all that, if you still have a problem I would go looking for defective accessories in your vehicle.

Normally D93 only fails if you connect the dc power cord up backwards. I'd take a look at the 2SA473 voltage regulator in TR41.

Well "fake" might not mean what it sounds like. The radio was manufactured by Ranger Communications back in their very early years. While I'm not sure who the exact importer was I do know that it wasn't the people that are selling the Galaxy "DX" radios today. You should still be able to trouble-shoot it with a DX88 schematic and most parts are interchangeable.

The info you need is in the Sams CB Photofacts for any of the MB8719 chassis such as
Cobra 148
Cobra 2000
Uniden Grant
President Washington and so forth.

31. Dashboard interference

Newsgroup: rec.radio.cb
Date: 2000-02-01 00:00:00 UTC
From: Southern Kiwi <p.mccaul@spamsucks.ihug.co.nz>
Message-ID: <875sgo$8o5$1@news.ihug.co.nz>
Source record: 22650

After spending 7 hours crawling over every connection in my petrol engine truck and checking *everything* I have narrowed the interference to the integrated dashboard (by pulling it out). It is stopped by pulling one particular wire out. This is all on connected to a circuit board, any ideas on how to stop it generating a strength 5 intermittent noise?

Cheers

Why are they called HDV amps, when actually your input
is almost the same as low drive.

With a "txstar 350HDV" I have been told to run a input of
1 - 2 1/2 watts with a audio swing from 15 - 20 or higher for a input.

What is ideal?

chris

This is untested:

Clarifier modification: TRC-453 and Uniden PC-122
1)Find the backside of the clarifier knob. 2)Solder the
bottom pin to GROUND. 3)Solder a wire to the top pin of
the PCB. This pin should be cut loose from any traces
going to it!) 4)Solder that wire to an 8VDC source.This
can be found on the second jumper behind the PLL
chip(IC-2). 5)Cut D-25.

Advertising.....

Actually the "High" drive units will "take" up to 10 watts (according to the specs)
But in actually all they do is add more resistance to the input circuit to absorb the power from your radio.

A properly setup "regular" drive unit and radio will perform the same as a properly set "High" drive unit and radio

A lot of the new Digital dashes (in the states anyhow) use a "DC to DC" converter for the display and a microprocesser.

These combined can create a lot of electronic noise..

Tam

Project for anyone, Locate one of the OLDER Calulators with the red LED display. Turn it on near any AM radio (CB, Ham, Shortwave or even a "Transistor" portable am/fm)

It's been said before in this NG, and it bears repeating....The way to avoid getting attention from the FCC is to keep your signal clean, don't annoy the neighbors, don't threaten the President over the airwaves, and stay out of the ham bands. The issue is not power or free-banding (until you do something to attract attention to yourself.)

If there ever was proof of the old saying, "The squeaky wheel gets the grease," it is CB radio.

QRM

The US Coast Guard has the authority to board a vessel and conduct a safety inspection with no prior notice. Seldom does the Coast Guard board small pleasure craft at random. However, should one of these boaters get in trouble and have to be "rescued" by the Guard, the owner can expect a full safety inspection. Every life jacket, fire extinguisher, vapor detector, etc., had better be present and in operating condition.

Good proof of the axiom that both are bankrupt, corrupt ideologies that have everything to do with imposing oneself on others, and nothing to do with morality, truth, or efficacy. Both of them stink.

Hello Southern Kiwi: Good going, way to go in trouble shooting, and locating your noise problem, a lot of guys won't go that far to fix the noise problem.

I would treat this noise problem with the dash board just like a fuel pump problem. I would first find out what it's function is, and the add a .1uF or .5uF, at least 15 to 25 VDC rating, capacitor, bypassing this wire to ground. Right at the dash board wire disconnect connection. The next step is is visit the local Radio Shack, and buy one of the cores that can be opened to wrap wire around them to make a inline choke, with as many turn as can be made. You will need a few feet (3 to 5 Ft.) of wire to do this with, I would suggest #20 gauge wire, with a good insulation. The choke should be on the vehicles wiring side, then comes the capacitor. It's possible the capacitor will significantly reduce or eliminate the noise by itself.

Let us know how you make out.

Jay in the Mojave Desert, ... just down the road ah ways from the fillin station.

59. New to CB - Need help

Newsgroup: rec.radio.cb
Date: 2000-02-01 00:00:00 UTC
From: Matt Bryda <mbryda@pa.net>
Message-ID: <876r1tmuq1@lore.csc.com>
Source record: 22678

Hello All!!
I'm pretty new to CB'ing and so far I love it. I have a few questions, though:

1) What kind of range can I expect with a magnetic mount antenna on my car? So far it seems I get pretty good range with my el cheapo Radio Shack antenna, but I should probably tune it.

2) Any listing of what channels are for what - I know 9 is emergency, 19 is the info channel, but are there more than that?

3) Any listing of CB clubs? Specifically I'm looking for something in the Harrisburg, PA area.

Thanks for all responses!

-Matt

No Tim, you're full of shit. I thought this was on your original comment of "Radio Shack doesn't make anything", not your mutating it to pick apart a response.

The item in question was a multi-band frequency equalizer. At the time I personally owned a SoundCraftsman 20-12, and it was top-notch, then the RS unit blew it away.

Other items that also fell into the same 'ratings' trap were things some of the phones. Even items that Tandy put their name on seemed to be 'downgraded' but for your arguement, they were not manufactured by Tandy, but marketed through them. Like the Beta HiFi deck made by Hitachi that had an 'audio' mode. It was truely fantastic.

But if you refer to RS 'image', then you have a point. RS sold 4 cassette decks that were absolutely fantastic. The SCT-30, 31, 3000, and 3100. Made by Hitachi, and blew away everything in their class for competition. In fact, on all four decks, the -3db and -20db curves didn't intersect inside the 'audio passband', they just rolled off smoothly. Incredible. But not many people would go to RS for $600+ tape decks with a 'Realistic' brand name. And RS speakers, other than a few niche standouts over the years, were pretty much dead thuds.

I agree, but it's not quite "The squeaky wheel gets the grease"

It's more of the Japanese expression of "the nail that sticks up
get's hammered down" kind of thing.

Mike

The same 'rules' apply to the Ham bands, the FCC's not interested in going after every lil' violator... they're more interested in the 'flagrant' violator. Takin' out one well known individual does more to stop the 'wannabes' and 'imitators' than ticketing some 'unknown' operator.

Always suprises me how many operators think the FCC needs a 'search warrant' to inspect their station... that somehow they can avoid detection or fines by cleaning up their station while refusing 'Uncle Charlie' entrance... they oughta' read the FCC FAQ site at: http://www.fcc.gov/eb/inspect.html

>The US Coast Guard has the authority to board a vessel and conduct a safety

Might wanna add 'operating erratically' to the reasons for an inspection. Around here the Sheriff's Marine Patrol has the same authority. In fact, they're more likely to be the ones who board your boat.

FM is illegal on the cb band and don't operate above 28 mHz unless you
hold an amateur radio operator's (ham) license.

I just got through wading through all the restructuring comments.--I think I have probably been around many years longer than most of you abd I can make a few observations. The FCC has acted--it did not listen to ARRL, Fred Maia, or many others--it did listen to QCWA. But no matter, it is over and it is what we have to live with--and the guy that was complaining about dems and repubs--that is inane--national politics has very little to o with amateujr radio--I should know because I spent a great deal of time in Washington. (DC) dealing with the bandits down there. The only time the pols are going to get into the act is when your neihbor has TVI--then we have troubles

Picked up a sweet little mobile in the local 2nd hand store the other day
for $14,its a RS,TR453,all it needed was a new mic,it appears to be the same
radio as a PC122,a bit different display,and of coarse the mic,cheapened
up,cant believe how darned good the thing works.

GMRS licenses are $80. for a five-year term.

> Both have the same efficency.

The only thing they have in common are that they are both in the UHF
spectrum.

Otherwise, your statement is ridiculous.

There is no comparison between 1/2-watt simplex and 5-50 watts
repeater and simplex communications.

Well l found out what the QCWA is , its an old-timer club . Watch out folks , l hope ham radio will now change , and get some young blood , though l am 38 , most on the bands are in their 60's or older ! This will breath new life in radio , and serious freebanders who are tired of the CB band will get modivated to move up to the ham bands where its more structured , and get away from some of the crap above 27.405 SSB . All chime on this !!

hmm. i missed the start of this thread but i have 112 dxcc on 11 meters voice from the last cycle. i stopped collecting cards or i'm sure the count would be even highers including this cycle. theres many 11 meter pirate groups that require you to prove youve contacted at least 100 and some are even 150 countries to become a member. listen on 11, Sugar Delta members need 150 to join and Alfa tango's need a 100 to join and theres a lot of people in both groups.

puchased a rci rg-66 from bills 2 way for 209$(i know 9$ over limit) to
replace my 79-290.
much better audio(79-290 was kinda fuzzy no matter what i did).
many compliments on the rci and none on the midland.the midland alsso had an
annoying habit of occasionally losing all memory(presets/bands)and that's
what finaly made me shelf it(not top either).
unable to add a dial-a-watt either(essential for switching between dx and
local.at least for me)
all in all the rci is second only to my northstar 990.would take this radio
over the grants(2 one old style other gt) or 148 gt(1).

a mag mount antenna with a coil is bad because running the signal through
the coil messes with the signals,both in and out.a firestick is a top load
antenna and doesn't have this problem as much.
the only prob with a firestick on a mag mount is that you need one hell of a
magnet to hold on in winds and bumps.i hooked one(4 foot) up to a k40 magnet
and it was ok under 55mph as long as there were no semis going in the
opposite direction.the magnet discolored the paint also.
my friend uses a 3 magnet base and it seems to be a good gripper.

Your antenna might have a ground problem. Get a good magnamount like a K40, Wilson 1000 or Anttron 1700 with a 5" magnet and your noise will be gone.

2 kw from 8 811's would be streaching a little bit....

Gonset made an amp line (along with lots of others) that used 4 811's
it gave about 600 steady watts if you leaned on it. (+100w drive)

But if you wanted to re-work things a bit you could up-grade to 572B's and
get more kick (1500w)

I would have to agree on the noise, but to answer your question, yes it will increase. I've used mine in a pinch when my mobile rig was down. Worked real well with my Wilson 1000. Only problem with handhelds I found is that modulation level isn't as loud as regular mobile or base radio. I wouldn't suggest using them as a permanent rig.

Hope this answers your question

Message-ID: <23510-38982198-1@storefull-126.bryant.webtv.net>
Source record: 22706

What I was getting at, is there are only 188 to 191 countries, depending on your source. Of those, only 188 belong to the UN. Where did your extra countries come from? Unless you are counting little bits of land and tiny territories, 200 some countries(verified ONLY through cards received) , seems highly improbable.

121. Galaxy DX77,DX99, 148 w/amp for sale

Newsgroup: rec.radio.cb
Date: 2000-02-02 00:00:00 UTC
From: wrd520@aol.com
Message-ID: <20000202082122.26653.00000880@ng-fp1.aol.com>
Source record: 22707

Following for sale due to new interests, figued I'd try the newsgroups for a few days before resorting to Ebay:

DX77 AM/FM/SSB mobile, echo, etc., converted and tuned for 11M,cosmetics OK, shows use,2 small holes in case from external spkr. mounted on bottom (included),operates great, needs meter light replaced. $175.00

DX99V AM/FM SSB mobile,echo, etc., converted and tuned for 11M, near mint cosmetics, working 100%, box/book/bracket, etc., Including Turner Road King 56 noise cancelling mike, very little use! $325.00

Cobra 148 GTL, older model, converted for channels, has a nice add-on RF amp mounted to the rear of the case, with hi-lo power switch, appears to do about 80-100W on high, cosmetics OK***** HOWEVER!!!! the previous owner wanted to convert this to a 4-pin mike plug and started by removing the small board with the 5 pin on it, then decided to buy another radio that I had. The board/socket is included but needs to be re-installed, shouldn't be a big deal for someone with the time to do it. includes mike, bracket, $150

Trades considered (SSB, 2M FM gear except HT's, or solid state HF units)

Shipping not included, buyer pays actual costs, sorry no COD's,prepaid MO only.

email replies please

124. Re: Magnetic mount.. are they really that bad ??

Newsgroup: rec.radio.cb
Date: 2000-02-02 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <c6Xl4.278$Gi4.12247@newsread1.prod.itd.earthlink.net>
Source record: 22710

Come on, that's a crock.

OK, here's the bad points for mag mount antennas

They are shorter (longer is 'generally' better)

They blow off

They capacitively couple to ground (the car body)

Water under the mount can discolor paint

'Sliding' the mount can scratch paint

Now some of the good things.

They are convienient to put on and off

They can be moved easily from vehicle to vehicle

They allow the antenna to be high

They capacitively couple to ground (the car body)

A mag mount antenna lets you get an antenna high on the car, where
you normally wouldn't put an antenna, either for 'cosmetic' reasons
like drilling a hole or mechanical reasons like no physical mounts.

As to the coil, you get what you pay for. Some are pure garbage.
I've seen coils that are actually ETCHED PATTERNS on a piece
of phenolic. REAL garbage! And this was a NAME BRAND!

If your coil is well made, and made from good heavy duty materials,
then the arguement that it's a liability to performance is BS. It IS a
tradeoff to a full quarter wave whip, but you're going to have that with
ANY antenna that's less than a full quarter wavelength. In fact, I've
seen some 'no name' whips that were 'top loaded' that had a VERY
light-guage wire, so thin that I would suspect lots of problems with
anything much over 5w. (Of course, I ONLY use them on 10M!)

And capacitively coupling to the car body, at CB frequencies, is
pretty much sufficient to act as a 'real' ground connection.

Where to put the coil? You can argue top-loaded, base-loaded,
center-loaded, continuous-loaded all day long. Each has advantages
and disadvantages.

By the way, with a mag mount, I always keep squares of 'wax paper'
in the car. I put one under the antenna (after wiping the surface with

a tissue) and it doesn't scratch the paint. If I leave the antenna on
for an extended period, I change the wax paper to keep a 'barrier'
between the antenna and the paint.

Mike

when a radio operator (ham or cb'er) uses the term "country" he is refering to DXCC enities not UN countries. right now there are plus or minus 330 DXCC countries that all count as seperate countries as far as radio is concerned. follow this link for the list of current DXCC countries and there corresponding 11 meter prefix numbers to see for your self. i believe we went thru this same thing with dwight stewart a few months ago.

http://home.t-online.de/home/IRDX.GERMANY/prefix~1.htm

>I had one couldnt get it to load the channels by doing what the mod
>said. Any help would be appreciated.

Don't believe the "mod" you see that says "Put away the golden screwdriver!". You need to find someone with the schemadics. I had them because someone emailed them to me, but I finally deleted them. You just drop a tiny drop of solder between two certian points on the detatchable face's insides, reassemble, hold down two buttons and BOOM, you have freqs from the 25 mhz area all the way to 10 meters. Just keep asking, someone will have that schemadic on the computer, will point out the place to put the solder and you'll be set. Even someone who has never modded a radio can do this simple one.

Just one piece of advice - get the claifier opened up, you'll be happier. I'm getting it done right now on mine!

Group,

I have tried all your sugestions, from the previous thread, but to no avail. It looks like it comes down to two things. It appears I am getting RF interference through the antenna. The whine is probably the alternator, so what size cap can I put on there to quiet it down? My local auto store sold me a condensor, and said it would work, but it didn't.

Second, it sounds like my fuel injector is also causing a HUGE amount of interference. It gets louder as the engine revs. (It makes an audible noise in the engine bay that coincides with the noise coming throught the radio.) Here again, what the best way to quiet it down? Only two small leads that dissapear into the intake manifold.

Thanks for your help, I'm gonna talk to some of you on the air yet! I swear!

Skimickey

yes, that means your driving the amp too hard. when you put it on low it has a built in pad to lower the input power the transistors see and thus makes it cleaner. when you get the chance reduce your drive until it sounds good on high and then run it on any of them.

At Radio Shack at least you seem to get what you pay for. If you pay junk prices you get junk. Their quality runs from bottom of the line to about mid way up but so do their prices. This of course is where the biggest market is. If you are looking for top-of-the line go somewhere else but be prepared to pay top-of the-line prices too. RS has had some pearls over the years. I have a set of their speakersa that I started to rplace with some Bose 301s. Did a side by side comparison with the RS and Bose speakers and could not hear the difference. Took the Bose back. This has been true of a tape deck, a couple of CB's, and a CD player, VHF handheld, their mobile VHF is a good radio but I personally have not owned one but know several who have. For the most part the good srtuff has been made for them by someone else, Uniden, Hitachi, RCA, Cobra ect and the stuff made by Tandy is the junk.

How about this:
I have a deep cycle marine battery with a 10 amp trickle that also has
a 50 amp
jump start setting. I'll run the amp off the battery with the charger on
10 amp
(leaving it on 50 amp would probably blow up the battery right?), and
I'll run
the radio off the 10 amp power supply (I also have a 5 amp ps if you
think that
would be enough just to power the radio only).
I sure appreciate your help and hope I hav'nt worn out my welcome!
How can I try to get in touch with you on the radio?
Ken,
TeXaS

Man your head is twisted,The ARRL is the largest amateur club in the
world and the awards they hand out as well as those from other clubs and
magazines are based on the DXCC list.
It was too quick and easy to work all countries so while most still
call them countries the proper name is "DXCC entity".
There are over 300 of these entities,many being small uninhabited
islands that are only on the air when someone travels there for that
purpose (these are my specialty).
Look up the DXCC list or even an amateur radio callsighn prefix
list,SEE I wasn't blowing smoke up your pantleg when I said I had worked
over 200 countries,we just define it differently.I use the DXers
defenition.

ok...here's why I hate unlocked clarifiers....2 stations...A, B, both with unlocked clarifiers.
A transmits...B listens and uses the CLARIFIER to fine tune station A's signal....B just moved his transmit signal.
B transmits, A recieves....uses his CLARIFIER to fine tune the signal.....guess what? He moved his transmit frequency.......A transmits, B has to once again retune....moving both transmit and recieve.....see where this is going?
normal clarifier operation
station a transmits, b moves clarifier to adjust recieve only....
station b transmits....a uses the clarifier to adjust the recieve only....
now both stations can communicate with no further adjustments.....
This is why I have never unlocked a clarifier on a rig. Tom

I'm new to CB. I have a Cobra 29 WXST, 18' of coax to a 4' Francis antenna, on a mirror mount with long bolts mounted to the back cross arm of the luggage carrier. I have had the radio peaked and tuned by a reputable CB dealer. In short the radia works very well with the car turned off, 4 to 5 miles good reception. The mini van is a 96 Nissan Quest. However with the engin running there is all kinds of electrical noise, half way up the meter. If I turn the squelch up to the point that the noise is gone so is almost all CB reception. I know that the electric fuel pump can cause this, but if I just turn the key to the point that the fuel pump runs the noise is only a very small part of the noise when the engin is running. The CB is on a lighter plug with a separate ground wire from the radio to a solid ground under the dash. What can I do to eliminate this dirty power?
Thanks for your help.
Jay

I noticed that go once I made the channel mod. It seems only when you actually get a singal or alot of background noise does the meter show up on the extra 80. Hey Andy, any thoughts on this?

In response to the audio squeal, mine will do it after all the audio mods I made if I turn the mic gain all the way up. If I back it out an 1/16 of a turn i'm fine and still clear and load without overmodulating. I think the squeal comes from the fact that when I cut the top side jumper, I did'nt trim it down to the board, only cut it in half and moved one side to seperate the jumper.

The first thing is to establish how the interfierence is entering the radio. For this test you will need a dummy load. Have your tech attach a dummy load to the antenna connection on the radio. Turn the radio on. If you hear the interfierence you can solve the problem with a DC in-line power filter. You can purchase these at Radio shack. If you don't hear the interfierence with the dummy load, well, you have a bit tougher problem. That means that the problem is radiated energy that your antenna is picking up the noise. The obvious first choice is the ignition system. If so change the wires to resistive wires that eliminate noise. Any auto parts store can help with this problem. If that aint it, you are on your own.

167. List of the rec.radio newsgroups

Newsgroup: rec.radio.cb
Date: 2000-02-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8782r6$8gn$1@news.hawaii.edu>
Source record: 22787
Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O

This is a very good answer, but I would suggest that before you do any
further testing that you should wire the radio properly by providing a
fused wire of sufficient gauge (perhaps awg 14) directly to the battery,
and do your best to avoid running that wire too closely to any of the
engine electronics or ignition wiring.

Wire your radio directly to the battery and make sure you have a good ground between the hood and the firewall. This will make the most difference. But be forewarned that it will not completely get rid of the noise. The best thing to do is get a radio with a Noise Blanker. This is NOT the same as an ANL or Noise Limiter. Most cheaper AM only radios don't have a Noise Blanker. It makes all the difference in the world if you have one in most vehicles.

That's my story and I'm sticking to it!

MC

180. *Take the NEWARK, N.J. school MATH TEST *

Newsgroup: rec.radio.cb
Date: 2000-02-03 00:00:00 UTC
From: dredge6226@my-deja.com
Message-ID: <87b191$l5i$1@nnrp1.deja.com>
Source record: 22749

NEWARK, N.J. Inner City Math Exam 101

1. Duane Spissedoff has an AK47 with a 30 round clip. If he misses 6 out of 10 shots and shoots 13 times at each drive by shooting, how many drive by shootings can he attempt before he has to reload?

2. If John Blowhole has 2 ounces of cocaine and he sells an 8 ball to Jimmy Nosecandy for $320 and 2 grams to Billy Nocash for $85 per gram, what is the street value of the balance of the cocaine if he doesn't cut it?

3. Richard Bignig is pimping for 3 girls. If the price is $65 for each trick, how many tricks will each girl have to turn so Richard can pay for his $800 per day crack habit?

4. Jacob Jewstein wants to cut his 1/2 pound of Heroin to make 20% more profit. How many ounces of cut will he need?

5. Willie Coolnig gets $200 for stealing a BMW, $50 for a Chevy and $100 for a 4x4. If he has stolen 2 BMW's and 3 4x4's, how many Chevy's will he have to steal to make $800?

6. Robert Whackya is in prison for 6 years for murder. He got $10,000 for the hit. If his common law wife is spending $100 per month, how much money will he have left when he gets out of prison and how many years will he get for killing the bitch that spent his money?

7. If the average spray paint can covers 22 square feet and the average letter is 3 square feet, how many letters can a tagger spray with 3 cans of paint?

8. Hector Spermancia knocked up 6 girls in his gang. There are 27 girls in the gang. What percentage of the girls in the gang has Hector knocked up?

9. POSEUR-Presidential candidate and unrepentant COKE USER ~ GEORGE. W. BUSH ~ shows up on your corner with 70 million dollars of dream money, how much change do you give him after selling him 2 grams of blow @ 85.00 each ?

Good Luck students! Test is due on my desk by 2:45 PM , this Friday.

Proffessor Rodriguez, jus' gettin' up,
over & out !

Ahhhhh! You do want to persue the avenue of semantics. Yes, we are in a radio ng. However, it says CB radio, NOT ham! And cbers count division #s when free-banding and DXing, NOT DXCC entities, or anything else considered "by hams". So why are you pushing the ham thing when it clearly states, "CB"?

From: Tam Green <tamarack@excite.com>
Message-ID: <87df2l$47s$1@news.ipa.net>
Source record: 22813

Yes...

To make the RK56 louder

Open the mike up.

Locate the point the WHITE wire from the cord is soldered....

Its on one side of a disk capacitor (most are orange)

Unsolder the white wire, relocate it to the other side of the capacitor
(there is already a wire there, solder the white wire to it)

Put the screws back in..

This will make the radio mike louder. (it will slightly reduce the noise
canceling of the mike)

Good luck

Its been done...
you will need to make the antennas resonate
(can't use CB antenna for top performance)
Actually a good UHF TV antenna will work if your not using 46/49 mhz phones.

There were/are commercially available antennas for this

But boosting power on the phones is illegal.... <G> Like most good things !

Rantings

If you check most of the postings from ebay you will notice that a lot of them are from businesses that try to make it look like a private sale.

Not that I am saying its wrong, but It does tend to confuse newbies (and some not newbies)

A lot of people are not aware that items listed at auction can have reserve bids that are not always met by bids.
yes this information is on the web site, but not everyone reads it

How ever, The reason I added the B) is because do to the way the post was worded its plain that the poster
was wanting to give a false hope that the price will be that low....

In the same fashion as the classified ads in the paper "Get Government seized Sports Cars for $50"
Its just a variation on the old Bait and Switch

Ok rant finished...

201. Information on old CB needed

Newsgroup: rec.radio.cb
Date: 2000-02-03 00:00:00 UTC
From: Power__House@webtv.net
Message-ID: <23265-389A408E-38@storefull-135.iap.bryant.webtv.net>
Source record: 22820

I received an email the other day (attached below) from a guy who had picked up an older CB unit at an auction. I have never heard of the brand, nor a radio that ever came with the items he decribed.

He said he will be checking the newsgroup for responces, but I'm sure he would appreciate an email as well in case he can't find the posts. Mail to: galey@catskill.net

Thanks for any help you can provide him...

ORIGINAL MESSAGE:

From: galey@catskill.net
Date: Tue, Feb 1, 2000, 11:33pm (CST+1)
To: Power__House@webtv.net
Subject: From+The+Manufacturers+Page!

Looking for someone who knows about a Nova Tech CB I picked up at an auction; looks brand-new in old box, probably from 50's or 60's. Has mounting bracket and capped screws in box, leather case and extra strap, antenna, earphone, AC adaptor. Has 2 phone jacks, "international code" A-Z layout on a direction locator antenna on top which swings 180 degrees. Has log scale, beacon, broadcast, and marine CB bands, DF level indicator, beacon/broadcase/marine/CB switch, squelch, and dial light button under the DF antenna. Labeled "nova CB" on front, and "nova tech DIRECTION FINDER - CITIZEN'S BAND RECEIVER" under the front speaker. Has "104 Japan" in raised letters on the bottom right of the case, and a plate in back middle that says "United Kingdom & Japanese patents pending U.S. Patent No. 3,164,833
Serial No. [blank silver strip]
Nova-Tech Inc. Manhattan Beach, Calif."
It's got a black plastic case with silver speaker
Do you know if this radio has any value (perhaps to a collector)? I haven't been able to find the brand on any of the CB websites or auction search pages (usually a good indicator).
Any response would be appreciated!
Yours on the air,
galey@catskill.net

Generally replacement is a lot easer..

The think i wonder is, Why did it break?
Did something happen to the amp?
The wire (even secondary) on that xformer is not all that small.
It could break on its own, but I have used transformers that are
well over 30 years old and still going strong.

Most of the time when they quite working its more than "It just broke" <G>

Washington Bases have the bleed over problem primarily because the
receiver is a single conversion design. I tighten up the front end on
one I had by installing a crystal filter on the IF. Before signals 6kc.
away were only -17 db now they're at -41 db BIG DIFFERENCE

I am running one of the newer 900 MHz. spread rectum type cordless phones with a Discone antenna up about 30'. I get about 1/2 mile range with this set up. The antenna coax is hooked to the base via a BNC connector I installed in it. The SO239 / PL259 connector combination is to lossy at these freqs., as is most coax. I'm using 65' of Times Microwave LMR cable and I'm still loosing 3db (half the power I'm putting in it).

I've done the same before with one of the older 46/49 MHz. phones too. Only that one I ran on a inverted Vee antenna. I had similar range on that set up as the 900 MHz. does.

If you need more Info let me know.

The A+ is bogus. It does not test real life skills or knowledge. Any test where the answers can be purchased is a scam. Unfortunately, the ham test also falls in that category now.

Ok, first you should know it is illegal to change the antennas
length to anything other than factory. Also, adding an outside
antenna is illegal.
Now that we're passed that, you can add a connector to the base
unit in order to attach an outside antenna very easily.
Since the output from the cordless is very low, you can't afford
any loss in the cable. The problem with the 900 mhz stuff is that
you would need some fairly expensive coax to run to the outside
antenna. If the run is only a few feet you might get away with some
9913. Any more than a few feet and now you're talking semi rigid
coax. ($$$) unless you can find some used somewhere.
The idea of dropping a power amplifier in the system is ok but
expensive. Also, you can't get too big with the amp because the
internal duplexer won't handle any wattage without burning up or, at
the very least, won't provide the needed attenuation between the tx
and rcv freqs.
You might improve the system range with just a rcv preamp on
both ends. Not too expensive. Probably a couple hundred bucks or so
plus the time to install them. The problem with the preamps is they
can and probably will overload the front-end of each receiver when
near a cellphone or business band/police radio. Plus there is a lot
of other stuff in/near the frequencies you're interested in.
I can think of few other reasons why I wouldn't bother...need I
go on?
At 46/49 mhz you're into the same deal plus a lot more noise to
contend with.
I think I'll pass on the challenge.

The amp will draw too much current from the charger while it is hooked to the battery.You may also pick up "noise" from the charger.You don`t want either of these two conditions.You need to isolate the charger or remove it while running the amp.

Bull Sh*t, Who ever said a change for the worse counted.
Example:
Here in New York we have the still married wife of a unconvicted rapist, liar, adultery committer and her team of Hollyweird freaks and screw ball's. All scripting a freak show using an *acquired empty house* to make her a senator..... to make things better, LOL

She has never been on the subway or come to see her *new* favorite New York ball, and hockey team's in fear of getting the Bronx cheer as well as Booed on TV.
Yet Rev.Al (a frequent guest of every jail) and the hordes work capable healthy welfare dwellers, homeless felons, ileagels and feminist's love her.
That is can not be good a good sign, its common sense.
Keep liberals out as long as you can.
NO THANKS !

227. No swing with new RK56

Newsgroup: rec.radio.cb
Date: 2000-02-03 00:00:00 UTC
From: thumper485@webtv.net
Message-ID: <20686-3899B1E3-21@storefull-218.iap.bryant.webtv.net>
Source record: 22860

I just got my new RK56 and I'm not that impressed. I wired it for my Eagle Sidewinder 400 and it worked good. Nice clean audio but only made the radio swing to 12 watts (mic gain all the way up) on AM. It will hit 17 watts with the stock mic (mic gain at 3/4) and 22 with a cranked up Astatic 575. I then rewired it and put it on a Midland 79-290, its intended home. Now with a 575 (volume set at 1/3,) the radio peeks at 20 on AM and 35 on SSB. With the RK56 it only peeked at 7 watts AM and 12 watts in SSB!!! Can anything be done to the RK56 to make it louder??? Thanks.

I'm sure somebody in the group has had a transformer go bad at some point in their modulating career. So, my question is this, who did you have repair it? I have a varmint xl-600 that has a wire broke on the secondary side (no, I can't get to it either, already tried) I was wondering if someone stocked replacements, or who is a good source for rewinding them? Please, don't think I haven't researched this, and tried to post a question so I wouldn't have to do any looking myself, I have tried for a month and a half, with very little progress. Maybe someone has schematics for this thing. Thanks.

Umm.. there's a reason that cell phones transmit at the levels that they do.. you go much higher on those frequencies, you start doing some harm to your body, especially with just a simple little hand held. Why would you want to boost the signal? The higher in frequency you go, the more dangerous high power gets.

Yes it is. I had one, and liked it a lot, however I later bought a
Teaberry SSB base station that was WAY better in the adjacent
ch rejection department. At the time I had a lot of other people
that were also on CB and they were very close, and I had to
either move or get a radio that had superior rejection and the
Teaberry did the trick. I did like the audio sound of the Washington
better, but it was always wiped out by the neigbors. Unfortunately
they don't make those any more(Teaberry Stalker)--but they can be
bought used if you are willing to go that route.

239. Is this site slower since remarq changed it ?

Newsgroup: rec.radio.cb
Date: 2000-02-03 00:00:00 UTC
From: mickey <MickeyNOMiSPAM@mickeys.co.uk.invalid>
Message-ID: <1ed6748e.3c1b330f@usw-ex0105-036.remarq.com>
Source record: 22872

Maybe it's my imagination but this site seems to run a lot
slower since they changed it. I'm running on an ISDN (digital)
line which is a hell of a lot faster than a normal phone line,
but it seems to run a lot slower than it used to.

Any one else noticed this or is it because I live in london UK.
Maybe I've just cracked up
Maybe I should take this up with the computer geeks on another
discusion group!!!!!!!!!!
Any comments ?????

Here in the UK every man and his dog now posesses a Mobile
(cell) phone about 50% of the population. They are given away
free as part of any package that you sign up to. I first bought
a cell phone in 1987 at the cost of 4500 of your dollars. and
the call charges where $1 per minute. A monthlly bill was in the
region of $500. I must have been mad, still it seemed like a
good idea at the time. The cell phone I used then was enormous
and it came with 2 antenna a quater wave and would you belive a
half wave. It was the size of a ten story building weighing only
slightly less and the joke was the battery life was only about
six hours. Now here in the UK we have just received delivery of
the new Nokia cell phones where the antenna is inside the case.
This apparently stops you from frying your head. But who
knows!!!!

The Wilson "signal booster" for cellphones is really an "antenna adaptor" that couples to most popular cellphones & sends the existing level signal to a glass or mag antenna that is Farther away from your body, so it it improves the signal by hooking up to a larger "outside" antenna, & at the same time gets those "harmful" cell freqs away from your body.......

COMTECH WROTE:

from all i've read here and other places
is the best antenna's WILSON and the K40.
Also what about a 102 inch whip?? of these
which would be the best to go with a Grant XL

will be installing it on a 2000 ford ranger

A good site but the below quote from the site is wrong:

"If you desire the best performance, the 102" (quarter wave)
whip is the only way to go."

If the above (quarter wave) antenna is the 102" stainless version,
then the quote is wrong. Other antennas show better performance so
that the 102" stainless is NOT the way to go.

254. Question?

From: tech <tech@dp.net>
Message-ID: <Pine.BSI.4.05L.10002031727110.29757-100000@home.dp.net>
Source record: 22887

I have two CB sets, one is a mobile, one is a base(?) although I'm sure could be used mobile if wired up. They are being offered up, AS IS.

If you collect radios or need them for parts, make me an offer with shipping included. Best Offer with payment in quick follow up response gets it.

The radios are:

Hygain Model 2679 comes with nothing except for the case itself and cable that the mike apparently plugged into. I think this PC board is one of the ones used for 10 meter mods.

Hammarlund CB-23 with AC cord. Nothing else. Unknown if either of these sets do or will work.

BOTH units AS IS.

Payment by U.S. Postal Money Order only. Gets immediate shippment.

I have a few other CBs for sale too, if interested. E-mail for more details. They are AM/SSB 40 channels and a couple 40 AM and 23 Am only. Though they have been tested and working, they too are being sold AS IS. Not modified to my knowledge. I do have a 142GTL which needs a slight repair or adjustment made to it.

I have received many requests for QSL cards from people who I never talked to.
I have asked them to send a card to my PO box. This must be too difficult.
No cards have appeared in the box from them, so I sent no cards to them.

260. BEST BASE ANTENNA ?

Newsgroup: rec.radio.cb
Date: 2000-02-03 00:00:00 UTC
From: DCLIFF@webtv.net
Message-ID: <20000-389A0F1E-12@storefull-112.iap.bryant.webtv.net>
Source record: 22893

I would like to know once and for all what really is the best all around base antenna. No beams,just the all around type. I know all people have diff. thoughts on "THE BEST" but I want to know for sure. I now use a I MAX 2000 and it does pretty good but leaves room for improvement. I have tried a metal 5/8 antenna and a Jo Gunn son of a gun. The 5/8 metal worked fair but the other referred to antenna was a piece of junk.
Thank's for any replies.

MY HOUSE WAS BURGLARIZED ON 2/3/00 BY A WHITE MALE THAT GOES BY
ROOSTER. HE HANGS ON CHANNEL 15 AND 17. HE LIVES IN THE LONGVIEW, TEXAS
AREA. I HEARD HIM DISCRIBING MY AMPS ON THE AIR.. A REAL DUMB ASS TO
SAY THE LEAST. IF ANYONE KNOWS HIS NAME OR ADDRESS THE LONGVIEW POLICE
AND I WOULD GREATLY APPRECIATE IT. HE STOLE A PALAMAR 350Z, AND TWO
MOBILE AMPS. ONE OF WHICH IS A RARE AMP MADE BY SILTRONIX, 100 WATT
WITH A BUILT IN MODULATOR. HE LIVES IN THE PINE TREE AREA OF
LONGVIEW, TEXAS. IF YOU KNOW HIM, BEWARE... HE IS A NO COUNT THIEF.
THIEVES AND FRIENDS HAVE A SHORT LIFE SPAN.....

If there is even a tiny bit of the end of the wire were you can get to it this usually fixes it. Take a drill bit the same size as the broken wire and wrap a solenoid on the bit using #28 buss wire. This should be close wound and one layer thick. Dip it in some liquid flux and slide it on the end of the broken wire and solder into place. They used to sell little repair thingies for doing this but they quit because once they came out on the market it was too easy to make your own. Hope this helps.

This is an idea i have been pondering for a while now"it might just be a redneck dream" Why cant you take a good lowband or 900meg coardless phone hook the base to a huge antenna outside your house 'LIKE A 5/8 wave gain" and also hook the hand unit to a stainless steel whip in your car and use this thing around town.I dont know the power on any of these phones but everybody is always preaching antenna is 90% of any station,so could it work?? If power could be boosted can a "amp" be built that will tx and rx at the same time like the phones do? I dont know, but it sounds possible! I would be cool to be able to be 7 or 8 miles from your house in town running errands and be able to take or make calls at no charge!! Now lets not have anybody posting about fcc laws even if this would be illeagel!!! WOULD is the magic word, this is just a idea and they are not illeagal!!! Thanks for any ideas or info on this subject!!

Not really sure of a whole heck of a lot about it from back then, Could have well been some 572B's instead. I have an 811a sitting on my desk and I seem to remember the plates being a little heavier looking on these tubes I didn't keep it very long. Only having a few bucks in it and a couple of hours work trying it out it went fast when a guy offered me $1000 for it. Cheap watt meters being what they are it could have been reading PEP. What I really remember most was that it used 8 4 pin tubes. I had always assumed they were 811As but this may not be reasonable now thwt I think of it. Still I doubt if there were a lot of other military amps made in this configuration. Power supply was on a seperate chassis and had a meter that read to 2kv but maxed out at1.5kv. There was a big knob on the powersupply that turning it would vary the voltage from about 800 or so to 1500. I remember tht somebody had scratched these points on the meter as tune and run.

> I need to extend
>the range of my cordless phone. Just so I can go to the end of the block. My
>house is about 5 houses away.

Observations from QRM: A 900 MHz phone, and the newer 2.4 GHz phones, should give a range of 300 to 500 feet. If your neighborhood's lots are 80 feet across, 80 X 5 houses = 400 feet.

Follow the other responders' suggestions, especially concerning the telephone's location. Height does not make much difference, really. However, keeping the base "in the clear" will improve range. Avoid having it near large masses of metal--like the refrigerator. The reason height appears to make a difference is that the second floor (bedrooms) usually don't have large masses of metal to block the signal.

It also is important to maintain a fully-charged battery. If your telephone is more than two/three years old, purchase a new battery and let it charge for 17 hours. You will find that it makes a big difference!

When operating the handset at a great distance from the house, a slight change in position can help. Don't block the signal with your body. Trees can decrease the range, especially when leaves are present. Move an inch or two to restore a fading signal.

Most telephones will carry a signal and will ring at distances greater than they will draw a dial tone. Testing can be deceptive for this reason.

Try different channels.

Spread Spectrum offers better range and a measure of security. (However, NOTHING is completely secure. Watch what you say).

Hope this helps. Give us some feedback when you find the ideal solution.

Sounds like what was known in this country as the "brick" by Motorola. Long, slim.

I still use them. And you're correct. They are big and heavy. But those were *real* antennas--not graphite rods. They will talk from places where the new, small phones roll over and play dead!

QRM

290. radio theory

Newsgroup: rec.radio.cb
Date: 2000-02-04 00:00:00 UTC
From: Bill Nelson <billn@spock.peak.org>
Message-ID: <87dk01$jh9$1@bashir.peak.org>
Source record: 22909

Some days ago, someone posted a url to go to www.free-seek.com to learn electronics.

My recommendation is "Don't waste your time - if you really want to learn factual information.

The site is just a bunch of questions and answers - usually with no discussion of why the answer is what it is. That does not teach you anything expect how to regurgitate memorized trivia.

The main problem is that many of the questions have incomplete, misleading or even incorrect answers. Following are some examples.

In "Communications theory unit #3" (the first I checked)

"1) List the types of transmission lines.
Two basic types are two-wire and coaxial
Balanced and Unbalanced
Two wire lines are usually operated as balanced lines meaning that both wires carry RF current, and include two-wire open-wire, two-wire ribbon (twin-lead), twisted pair, and shielded pair.
Coaxial lines consist of two main types rigid coaxial line and flexible coaxial line. These usually operate as unbalanced lines, meaning one line carries RF and the other is at ground potential."

Now, what is wrong with this? First, there are more than two types of transmission lines, so the answer is incomplete.

Some types of coax contain more than one conductor inside the shield.

Coax is always unbalanced - there is nothing "usually" about it.

Both the shield and the center conductor carries RF current. The shield may (or may not) be at DC ground potential - but it is never at RF ground potential. Efforts may be taken to eliminate RF currents on the outside of the shield, but they always occur on the inside of the shield.

"3) Determine if a line is long or short. (electrically)
Long transmission lines are lines that are 1/4 wavelength or longer.
Short transmission lines are lines which are less than 1/4 wavelength.
If you were propagating a signal at a frequency of 200Hz. The equation for the wavelength in meters would be 3 EXP/200 Hz = 1.5 million meters per second. ..."

Deleted - computations of "long" and "short" lines.

"... a line can be electrically long but not physically long in measurement. ..."

Problems:

"Long" and "short" are meaningless, unless you specify some reference.
The authors have claimed it is always related to 1/4 wavelength, which
is not true.

When you solve the equation given, it produces meters - not meters per
second.

It is impossible for a line to be electrically long but not physically
long - by any reference. For that to happen, the propogation factor in
the transmission line would have to be higher than the speed of light,
and this is a physical impossibility.

"5) Know how to calculate the characteristic impedance for a given line.
... Z0=Square root of L/C."

Problem:

This is NOT how the characteristic impedance of a transmission line is
calculated. For parallel conductor line (and neglecting the effect of
any insulating spacers) the formula is: Z0 = 276 log b/a, where b is
the center to center distance betweent the two conductors and a is
the radius of the conductors. The units don't matter, as long as they
are identical.

For air insulated coax, the formula is Z0 = 138 log b/a, where b is
the inside diameter of the outer conductor and a is the outside
diameter of the inner conductor.

"6) What is a resonant transmission line?
A resonant transmission line is one in which the capacitive and
inductive reactances cancel each other and has a finite length or
is not properly terminated. That is not terminated in an impedance
that equals its characteristic impedance. Some of the energy is
reflected back to the source and forms standing waves on the line."

Problems:

Whether a resonant line (at a given frequency) is properly terminated
or not is immaterial.

Nor are the capacitive or inductive reactances cancelled if the line
is resonant. If that were true, then you could have a transmission line
with a Z0 of 0 ohms.

"7) What is a non-resonant transmission line?
A non-resonant transmission line is a line that is of infinite length
or one that is terminated with a resistive load equal to the characteristic
impedance of a line. A transmission line is said to be properly terminated
when the resistance of the load is the exact value required to dissipate
energy at the same rate at which the line feeds energy to the load. The
circuit is non-resonant if:A) the circuit is purley (sic) resistive over
a continuous range of frequencies, or (b) the circuit contains capacitive
and inductive reactances that do not cancel each other."

Problems:

An infinite length line would be resonant at ALL frequencies - by definition. For any frequency, it would be an infinite number of wavelengths long.

Terminating load has nothing to do with whether the line itself is resonant on non-resonant.

A load will always dissipate all power fed into it - either by radiating it or dissipating it as heat or light.

A transmission line is properly terminated when the impedance of the load matches the characteristic impedance of the transmission line. The radiating efficiency of the antenna depends on whether that load impedance is purely resistive, or has an inductive/capacitive component.

The bit about a non-resonant circuit is garbage. For example, a resonant antenna presents a purely resistive load to the coax, just the opposite of what is claimed by the authors.

There are similar problems with just about every one of the other questions/answers that I scanned. Many, when not wrong, are either vague or incomplete in the answer.

For 4 or 5 supposedly A+ students, I have to worry about the quality of education at their school.

Sheesh. What kind of lousy hardline are you running? Even RG-8 foam only loses a bit over 5 dB for 100 feet at 900 MHz. With 65 feet of RG-8, the loss would only be about 3 dB. The connector loss should be negligible.

In designs, I allow 0.5 dB loss for each pair of connectors - but it is actually far below that - except possibly when using SO239 and PL259.

IMHO, I would suggest The Wilson 1000 or Wilson 5000.
The k-40 cant handle too much power (Believe me, I got 6 sitting in the corner over here that were blown from running 200 watts or more, all from people who cant read). The 102" whip is another great antenna. The only drawback to either one is, The wilson has several mounts for it, but you might not want to drill holes or scratch your paint from the magnet. The 102" whip however can be mounted and still have a good clearance over the top of the cab by mounting it to the bumper if you can, Only thing is that they are real tall and have a tendency to hit the body from swaying (Nothing a tennis ball with a hole in it cant cure). The choice is yours, but I strongly suggest not using the k-40.

The Uniden Washington is the most popular rig for a cheap base station that works really good. However, If you are looking for something to compare to The Tram, Try looking at the Galaxy Saturn or even towards an old Cobra 2000 gtl. The Saturn will do stock wattage at about 12 watts am and swing to whatever. Mine dead keyed on a Bird Meter at 12 watts and swung to about 65-70 watts. Plus the Galaxy line of radio have alot of features not found on the Washington or even the 2000 gtl.

Connect an external antenna to it and put it on the outside of the house on a mount over the roof. Be advised, The more range you get, the better scanners can hear you and further away. Also, if you have a removable rubber ducky antenna on the handset, you can get a telescopic antenna for it and that will also help along with the outside antenna on the house.

I dont have the specs for this, but I made a 1/4 wave ground plane antenna for my cordless base set and was able to talk 5 blocks away. Almost like having a local only cell phone for the neighborhood.... These blocks varied from 1/10th - 1/4 mile in length. At the longest block, There was alot of white noise but was still able to connect to the base, dial out and talk with some difficulty.

Body handling: HTML body converted to readable text

The most popular and not too expensive antenna would be an "Antron 99". I have used them and they are very simple to install even with the addon ground plane kit. I however use a "Penetrator 500" on my base and seems to get out and receive a little better, But harder to install on a 50 foot telescopic mast.

Use a small Electrolytic capacitor, A SPST toggle switch and hook one end of the Capacitor to ground (the cap is clearly marked which side is ground) and hook the other side to the switch. Then run a wire to the positive side of the relay from the other side of the switch. Be sure you use a capacitor rated over 20+ volts and dont use one that keeps the relay closed too long. 1-1.5 seconds is average for ssb delay. Also, If you have a seperate relay for your receive amp, be sure you turn it off so you know which relay is engaging the TX. I have done this to commercial and amateur amps and have had no bad repercussions. As long as you know the basics of electricity, you shouldn't either.

I hope you didnt say that you use them on CB... If you did, you might as well not waste your time with the police and do something about it yourself. If you did, The police department has the right to confiscate the equipment and dispose of it in a proper manner, even if it was stolen from you.

Being familiar with Alincos', A clarifier is not needed since they use
a VFO instead of just a channel selector. However they do have one on
there ssb rigs (called "RIT"). An unlocked clarifier is best used when
properly alligned. If your clarifier is off by say at least 2kc,
Another user with an Unlocked clarifier maight have difficulty tuning
in to you since you will both have to make adjustments due to the 2kc
difference. Make sure it is properly alligned and you shouldnt have
any problems....

how much are they - in Aust they cost $350 including groundplane kit - I bought one secondhand (including groundplane kit) for $90 about 7 years ago, just wandering how much we get ripped of here??

A word on the care and feeding of cordless phone batteries:

(1) Examine the metal electrical contacts. Clean as necessary using a pencil eraser, followed by wiping off the eraser dust with a clean paper towel.

(2) Occasionally discharge the battery completely. Best way to do this--unplug the telephone line cord from the base unit. Then activate the handset and let it run all day. Recharge for at least 10 hours. Reconnect phone line to base.

This prevents development of a "memory effect" in the cells. Good battery power is a key element in cordless phone operation.

You're changeing the subject instead of answering the question, Robert. The subject is not about change. The subject is about why a date is a reason for change.

What does a date have to do with change? Why does a date justify change? Why do people say, "its the year 2000," to justify the change they want, when the year 2000 is a date, not a reason?

It would make just about as much sense to say the sky is blue, so we have to change ... (insert whatever). There is simply no connection between the two.

Dwight Stewart (W5NET)

Well that's not true. The sky is always blue it is the year 2000 for the first time. I believe the correct interpretation is , "There is no time like the present."

Mark, K1MKF

Better yet! Leave the Police out altogether!
You will lose you equipment to confiscation and
personal justice is so much more rewarding!
I wouldn't threaten a person's life though.
But bodily injury sure makes them remember what
they've done! Just make sure that they don't know
who is seeking revenge!

Another way if you find out who it is!
Let him know, everyday, that you are going to
get him when he least expects it. By the end of
the first few weeks, he'll probably walk out in
front of a truck while watching over his shoulder!

We gotta rid society of this kind of slime!

Good Luck! Hope you find him!

Okay, I can follow this as I was thinking of this anyway, but how? Where do I connect the antenna to the base? Right where the antenna that comes with it screws in? Via alligator clip? I don't even know if its one of the old 49mhz or 900mhz. How do you tell? Wow, alot of questions.

>I dont have the specs for this, but I made a 1/4 wave ground plane
>antenna for my cordless base set and was able to talk 5 blocks away.

If you find them, I'd like to have them. Only problem with that is I don't know the operating frequency. It was given to me. (Guy said it didn't work. All it needed was a battery.) Thanks for all the help everyone is providing.

Regards,
Jeff

Radio Shack meters are week. There not very accurate.

>a) Is this in accurate since I dont have dummy load test equipment?

Not necesarily. As long as you have a good SWR, then you should not
have any probs.

>b) Does my radio have to be "tuned" to work properly with this amp other
>than lo rf power output of radio?

It depends if the linear is a high drive amp. If it requires a power
of say "4-watts", Yes it needs to be tuned to the radio. It is best to
have it tuned while in line with your antenna. I notice that a power
output of 3 watts from the radio is sufficient and wont cause as much
TVI, let alone still have enough to drive the linear without abusing
the linear in the process.

Single conversion is un acceptable these days.
Does anybody make a dual conversion reciever with .25 uv. sensitivity?
My old tube type Sonar FS-23 has a receiver that rejects just about
everything. It hears very well but is only 23 channel and uses lots of
power. I need a rig that is solid state and built like a professional
receiver should be built. Do I have to buy ham gear to get that?
Or is the ham stuff junk too?

Used to be 27.155 on 23 channel rigs .Used to be 27.365 27.405 when 40 channel rigs came out. Now it's mostly ssb above 27.405 you can try AM but you will usually catch alot of flack from sidebanders. Usually below 27965 is AM This is what i found in last 30 YRS. This will stir up a hornets nest probabally. But if your after me your leaving someone else alone. TNX HAVE A GOOD DAY

An awful lot of CBers DO go by the DXCC list,many more than go by the
division #s you speak of.Just look back thru the posts.

Since the stuff I snipped had no mention of any specific construction project, I'll assume you meant the traps for your gravity-inverted vee.

Why not? As I've mentioned here (RRAA) before, Hams used to be able to build their own _tubes_! Tasks like winding coils and stacking caps are cake compared to glassblowing, and much safer (silicosis).

There is the problem of assuring value stability once the parts are built. You can calculate of course, but edge effect creep in with caps, and inductors like to "grab" nearby magnetic materials and change their values. Coils are fairly easy to tweak if you make provision for that during construction, but trimming a homemande cap can make you crazy. Choose wire size and foil/dielectric for power-handling capacity, and go for it. Oh, and don't worry about the smoke, it's traditional ;>)

Thousands of poor souls must have considered the exams for the last five years tough. The number of Generals has been about equal to the number of Advanced holders. If the exams were so easy, why didn't the thousands of Generals upgrade?? no code was required. What makes anybody think these Generals who couldn't--or wouldn't--pass the Advanced exam will now jump to Extra??

> screws in? Via alligator clip? I don't even know if its one of the old

that might work but for better results I would modify the case of the base
and install a bnc connector or something of that nature by cutting the base
out to fit the connector and solder the wire on the inside that connects to
the antenna screw. If you don't know how to do that or don't want to take a
chance at destroying your phone then try an aligator clip or screw the new
antenna cable to the mount.

49mhz or
> 900mhz. How do you tell? Wow, alot of questions.

the easiest way to tell is look at the base antenna. If it telescopes then
it is a 49mhz phone if the base set antenna is one piece then it is a 900mhz
or higher phone.

hope it helps

Something I have wondered as well, for many people the theory is just as
bad as the code (or worse).

There will be some upgrades, there will be some new Generals/Extras. The
average age of Hams will still go up. Also, after the first 'burp' of
new/upgrades has happened, the number of Hams will go -down-.

This is due to a number of factors: 1) Most people (us included I guess)
would rather be on the 'Net on then on the air. 2)It will still be
"difficult" to become a Ham (while all it will take to get on the 'Net is
$$$). 3)The attitude of some shown here will be reflected (just as it was
on the no-Code Techs), causing the new Hams to feel unwelcome, and they
will drop out.

The FCC handed us a flawed policy, the best we can do is live with it
and -NOT- blame the new/upgraded Hams. Else we -will- drive them away and
the the hobby -will- die.

Exactly, I predict a bunch of tech+'s jumping to general for the privileges.
I predict a bunch of advanced jumping to extra. I predict the great majority
of generals not jumping to extra.

Don't know Cecil when I took the General test at the first of January there were nine people there all were Generals or Technician plus operators upgrading. We went back to take the Extra Test on the Second of February and there were over 30 people there mostly Technician plus and Generals upgrading and several old time Advanced operators taking the Extra test. Several more were taking the five word per minute test on their way to getting a General or higher license class.

I have been to one of these session several times the last few years and while they usually had five or six people each time, I have never seen it where they had to use every table in the room and add four more along the wall just to accommodate all the people who wanted to upgrade.

The same has been happening at other sites around here. The one where I took the advance Test usually had only three to five people upgrading on average and they had twenty people taking the test. again most of the people upgrading were long time Generals or Advanced class operators on their way to getting their Extra class ticket.

Maybe this area is just a isolated occurrence but I am willing to bet that the number of people who will upgrade to General or higher will far exceed what most of the PCA's think. I know they would like to believe that anyone who has not passed a twenty word code test in the past has no interest in upgrading their license class but I strongly suspect that will be wishful thinking on their part.

Now before old Dick or one of his cronies cries out that these people are not real operators and are taking the easy way, let me say Most of those I talked with were long time Advanced and General class Amateurs and more than one told of taking his last test in front of a FCC official.

Before April 15 of 2000 you still need to take the 13 wpm code test
and the wrttien test to upgrade to general from Tech +.. After april
15, 2000 that changes to the following.:

those licensed as TECH + before MArch 27, 1987 that can show this as
proof will just send in the proof and the paper work and pay the
appropriate fees to get there General license.. Those licensed after
the March 27, 1987 Date will have to pass a 35 question written exam
to obtain there upgrade.

You can read all the info about it on www.arrl.org

The HTX-100 is like the 2510 as far as the mods are the same just different pins. The 2510 uses 34,35 to get extras and the HTX-100 uses 24,25 modified the same way. the only real difference is the HTX-100 Stock radio has only CW and USB modes while the 2510 is an ALL mode. The HTX-100 can be changed to have LSB but need internal radio modification done.

Source record: 22974

I have a 5 month old Midland 79-290 with all the frequency mods done to it. No power mods have been done. Only the VR pots for have been turned up. The radio peeks at 40 watts in SSB and 25 in AM. The radio works great, I just can't stand the receiver on it. I would like to trade it for either a working Eagle Sidewinder 400, Uniden PC76XL with weather and an Expo kit, Grant XL with channel mod or a PC122XL with Expo kit. Thanks.

Source record: 22976

I have an excellent RCI-2980 fully modified in excellent condition. I bought this unit along with a D104 (Black) at RR Electronics in Delaware they also installed a box inside to boost the modulation which cost $75.00 and a switch to turn it off or on on the back of the radio. This radio and Microphone are like new and all come with original boxes. A big change in my life has occured and I need to sell this. I also have a Palomar Skipper 300 with 4 8950 tubes. The amp pushes 350 watts and can go higher but only tested and lowered to see how much power I had in reserve. It also has a working pre-amp. Shipping is included with this price and only serious inquires. $600.00 firm and local pick up is OK in Wilmington,Delaware and you can test it out. I also have a Anttron 305 antenna I will let go for local pick up $50.00
$600.00 gets free shipping/RCI-2980/D104/Modualtion Booster installed inside of radio and Original mic and boxes.

Greetings!

You might want to brush up on your Co-phasing descriptions...

The whole effort of Co-phasing is to generate a beam-like pattern that enhances receive and transmit performance. But only in certian directions. This is dependent on both the length of wave the harness will use, as well as physical distance the antennas are from each other.

Co-phasing, using the proper wavelength distances, and harness [coax length] gives you an interference pattern of both constructive [reinforces wave] and destructive [cancelling - removal] interference pattern.

You did a good job, but needs a little work.

One area that is not discussed - counterpoise and the effects the antenna as a radiator, and the ground plane image the radiator has to work with. This could tie into the coax length scenario very easily.

You also did not bring up how the ground plane of the vehicle in mobile setups, can benefit from locating the antenna in a spot that allows for ideal coupling of the radiator and the ground plane the vehicle makes at the right locations, and therefore removes the issue of coax length and if it's necessary or not.

Another issue not discussed, the velocity factors of different antenna elements using different metals can also affect the required length.

Brass and Copper run about 96" - 98", while stainless steel uses 106-108" to obtain the true needed length.

Don't worry, I'm not here to flame you, in fact I'd like to offer users visiting my site to your site as well. I'd just like to see more in-depth to help make the operator aware of the different factors that can make these "myths" seem true at times.

On Fri, 04 Feb 2000 03:16:44 GMT, while the modem was pondering it's navel, "Jon" <jtec@#cnw.com> dissertated the following:

Greetings!

SSB mode uses the "Audio sub-band" portion of each frequency.

Since the carrier is produce at the specific channel frequency, the
true "audio" bad would be anywhere between 2.5KHz above and below, and
work downwards to about 100Hz above and below the center carrier
frequency - that is in a stock CB radio with SSB.

So, when looking for understanding, remember that the SSB audio is the
same frequency location as the audio from the AM types.

Only the AM types produce 2 audio sub-bands, while SSB uses only one.

The "starter" frequency of the RF to produce the SSB audio - it's
offset is approximately 2.5KHz [2,500Hz] above and below - so in USB -
channel 20 [27.205] is really at 27.2075, while LSB is 27.2025. [This
is the "starter" for the audio to be properly mixed to produce a
SSB signal.]

Why? Because the audio bandwidth. Or the frequency response
of a SSB radio, is designed to be narrower in response when
a SSB signal is decoded. In this case, CB's are regulated to
have only 2.5KHz of audio bandwidth - and many of todays
radios are a lot less in bandwidth, more like 1.5KHz.

Which is why audio sounds a little [or quite a bit] different than an
AM only radio. Very narrow band of frequencies to listen to and use.

Those things that firestik sell are over priced (Some 50 bucks if I remember correctly), plus the way they have you hook it up is bogus. Clipping a alligator clip that is attached to the feedline center conductor to the existing antenna is in no way make a proper return path for the RF. The ground plane just floats not connected to anything. If they do give an improvement it is probably due to the feedline acting more as the antenna than the antenna is. Save a bunch of your money, get one of the CB dipoles I am selling on Ebay right now: http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=250083445

Cut it down to resonate on 47.5 MHZ, (each side about 64") set it up as a inverted vee or sloper so it is vertically polarized and you will be pleased with the results.

PS. After all this diatribe , if anyone still wants one of the firestik things, I've got a new one (unopened package) setting around the shop that I'd love to sell to someone I don't Know. ;~) After getting it sometime back and seeing the cheesy way they had you hook it up I didn't want to sell it to someone local here. If you redid the feed line hook up it may be all right, although as lossy as their CB antennas are I can't help but believe that their mega turn small diameter coils aren't going to to do much more than warm the shrink wrap at 40 some MHz.

On average I saw 15 to 18 miles base to mobile. I must confess
that I have the equipment and access to specialized devices through
my job that enabled this, otherwise it would have been cost
prohibitive to try.

I don't like the ineffective automatic noise blanker and ANL system. Its fine for out in the woods but it sucks in the city.

Hi Jeff,

You don't have to install a connector. Just open up the base, remove
the existing antenna, run the coax in the hole created by removing the
antenna. Solder the coax center conductor to the connection point made
by removing the antenna and the coax shield to any ground close by.
Don't just clip it to the existing antenna. You can end up creating
such a impedance bump by doing so the result can be as bad as no
antenna.

De Tim

Although the modification is relatively easy, you should have
some basic test equipment and knowledge of your radio so that you
don't become one of the disenchanted open clarifier users that are
talked badly about by some here.
Without trying to sound uppity, the mod you ask for is simple
enough you don't need a book to do it. If you can't figure it out on
your own then you probably shouldn't be messing around inside.
Sorry.

Better double check the restrictions, the government mandated the mini-dish allowance but that does NOT mean that any other antennas are allowed! I know because I've been on the board of our association for 4 years. Just be sure, that's all.

I use an even older TRC-422. That ugly sucker talks!

Plug a PA horn into your PA jack. In CB mode, the internal speaker
is active. In PA mode you have a public address function. In MONitor
mode, the CB will be heard through the PA horn.

BTW, a PC-122/TRC-465 will also output CB audio through the PA
speaker in PA mode.

Hi WF!

I have heard that the AM mod is different than the sideband mod. I
found a site that had the SB mod, but no AM only mod.

I found another site that has a book on PLL's that looked good and
covers the upD858. Book costs about $20.

Check out

http://www.cbcintl.com/PLL_Book.htm

For those interested. The main site has some interesting stuff on this
topic as well.

thanks and numbers - poofy

I don't know the mods but I know it can be done. I had mine worked on the in Houston and with a super mod the radio did a dead key of 3 watts and a swing of 24 watts. When turning the dead key down to 2 watts it only would swing 19 watts. So the radio can take a super mod. The first 2 shops I went to also told me the radio could not be modded.

Check out my ever changing classic video game trade/want list along with my collection here.

I had one of these and agree with you it was very sensitive to city noise.
Neon etc. and the lack of a good RF gain control made it hard to live with.
But in the woods it was great. I find your 40 watt SSB claim extreme.
I believe mine run about 28 watts peak.

Some good suggestions, ... try to wire direct to battery (I like starter solenoid post from battery), good
ground straps on hood, noise filter in power line, move antenna to rear of vehicle to eliminate antenna
picking up electrical noise, get good in roof style antenna instead of mag mounts or not very well
grounded type.

Previous post mentioned a dummy load, you can just disconnect the antenna and get similar results.

And this mag mount is supposed to be grounded? lol

Chris wrote in message
<15767-3897856C-60@storefull-217.iap.bryant.webtv.net>...
Your antenna might have a ground problem. Get a good magnamount like a
K40, Wilson 1000 or Anttron 1700 with a 5" magnet and your noise will be
gone.

Oh yeah and which state or local police department can legally enforce this law? and how the hell are you breaking the law by having it in your possession? come on, get real smart guy....If a licensed radio operator reported it stolen could the police confiscate it as well? or do you believe that they have a little "pull" in the matter? how the hell can they prove that it is being used in a non accepted fashion, surely not because some snobby ham believes so. Just because it will operate in the 10 meter band or has a keying circuit built into it, it is only illegal if you are using it on the cb or give them reason to believe you have been using it.....

Source record: 23026

Wrong again smart guy.

Type Accepted HF linear amplifiers can be freely sold or purchased.
It is forbidden to offer for sale HF linear amplifiers which are not
Type
Accepted unless they were manufactured prior to April 28, 1978 (when
the Type Acceptance requirement was implemented). See exception
below.

The relevant regulations are 97.315 and 2.815 of CFR47. Regulations
carry the force of law. They are the implementing acts of a federal
law, and are authorized by that law. Therefore they have the status
of law.

Now an amateur is authorized to construct linear amplifiers for
his own use, but no more than 1 of any given design in any given
calendar year. He may sell that amplifier to another licensed
amateur, or to a dealer for resale only to another amateur. This
is covered in 97.315. The limit of one per year is to prevent abuse
of the privilege of being allowed to build amplifiers by turning it
into a sub rosa business. The prohibition on sales to other than
another amateur is to prevent these amplifiers from falling into
unauthorized hands.

Mere possession of a non-Type Accepted amplifier by operators
in another radio service which doesn't authorize the use of that
amplifier
is forbidden by 2.815. So, for example, if the FCC finds a CBer in
possession of an external HF amplifier, they may immediately seize
it as contraband. They are also authorized to seize dealer stocks or
manufacturer inventory of any non-Type Accepted HF linear amplifier.

To receive a grant of Type Acceptance, a HF linear amplifier must
exhibit zero gain between 26 and 28 MHz, have less than 6 dB of
gain between 24 and 26 MHz and 28 to 35 MHz, must require a
minimum of 50 watts drive power, and be so constructed as to
not be easily modifiable for operation in the 26 to 28 MHz frequency
range. That's covered in 97.317.

I've got one that's broke. Got it at Radio Shack in about 1969. I believe it was one of RS's special purchases of units from company's discontinuing a line or product or going our of business. It is only a receiver. NovaTech made similar models that covered the VHF Marine band or Aircraft band. The CB part is actually a crystal controlled converter that converts CB down to either the MF marine band or BC band. All of the similar radios had the LF beacon band, the AM broadcast band and the MF marine band plus CB or VHF. From what I remember, it was a very good receiver. The rotating bar antenna worked on the lower bands for homing in on and taking directional fixes on stations for marine navigation. I think your friend has made a good find! One of these days I might have to get mine working again.

GENERALLY, the AM'ers run channel 1-30, and the sidebanders run 31-40. If you are into 'free-banding', the AM'ers operate BELOW 26.965 , and the sidebanders are ABOVE 27.405. Umm... that's what I understand. :>)

xxxxx
Does anybody have any specs. on the Cobra 2000.
Would like to know where to get a schematic for one.
If no company makes a decent receiver anymore, how do people settle
for radios with only one i.f. stage like the Washington. That radio has
to
bleed terrible.
Reminds me of the old Cam-88. Now there was a radio that could hear all
23 channels at once. Piece of junk as a receiver.

With today's solid state devices and filter technology, a company could
produce killer radios at low cost.

crwdog wrote:

"don't know what type of messed up meter you did that on but I will say you full of BS"

No bull about it. I took it to get it peaked and have Q33 cut. After the tech did a regular peak and tune job (no amc cutting) using some kind of scope and a bird meter (I think thats what he said) he told me that I really wouldn't see much of a difference if he pulled Q33 out of it. He also did a frequency alignment for 10 meters. Why is that SSB peak reading so hard to believe? The radio has a 2166 driver, dual 1969 finals, and a very heavy duty finned heat sink back panel. If it makes you feel better the peak readings were 10 watts AM, and 17 watts SSB with the cheap stock mic when the radio was new out of the box. The higher readings the tech got were with an Astatic 575 while yelling AAAUUDDIO, HHEEELLO.

What you think of idea of realization of radioexpedition on Southern Altai?

Southern Altai - highland is on the board of Kazakhstan, Russia, China and Mongoly.
Land of lakes and waterfalls, mountain taiga and stormy rivers, deserts and snowy peaks...
In time of Soviet Union this territory had been absolutelly inaccessible for foreign tourists (and furthermore for radioexpedition) - in locale
It is not enough of ham stations.

The base camp of expedition is planned to place in region by highest Fastigiums of Siberia and Altai of a mountain Belooha, lake Markakol and Zaisan.

If you were interested by our proposal, we can be found on ranges 21Mhz, 28Mhz call sign UN8JZZ (collective radio station)

I havent got a clue as to it being true or not, But it was stated by a local Sheriff and California Highway Patrol in the San Francisco Chronicle, that a truck driver was pulled into a truck scale and his equipment was confiscated on the spot without FCC agents on the scene. This was reported about a month ago and since then, there were other accounts in other counties of similar actions, one being in a house. Nothing was stated in the Paper about this being legal or not.

Poofy, re:

> it is an older TRC-452 radio (Uniden) -thought it would be fun to do and play with. thanx - poofy

I have a few 452s. My *favorite* AM-only radio. One of the best receivers with incredible ajacent channel rejection AND one of the loudest transmitters once the audio pot has been turned up. Overall a GREAT radio (I also have Trams and Brownings).

The 858 chip is a little hard to reach on this radio, since there's another board covering it. However, once it's reached, it's the same modification as the sideband 858 radios (ie Cobra 138XLR, TRC-449, etc). However, for some reason, this radio *does not* have the same channel range as the sideband counterparts. I've gotten mine to reach ~ channel 75 and ~65 channels below 1, versus the sideband versions (with the same mod) going 100 channels below 1 and up to channel 104. Anyway, it's a great radio---enjoy it!

440. Founder of Swan and Siltronix Radios Dead

Newsgroup: rec.radio.cb
Date: 2000-02-05 00:00:00 UTC
From: k8cpa@qsl.net
Message-ID: <389c1762.129063334@netnews.att.net>
Source record: 23080

This came in from the ARRL news I get via e-mail....

Siltronix Radios are not mentioned, but he did build them.. you see the similer styling of the radios.

SWAN, ATLAS RADIO FOUNDER HERBERT G. JOHNSON, W6QKI, SK

Herb Johnson, W6QKI--who founded Amateur Radio equipment manufacturer Swan
Electronics in the 1960s--died February 1. Johnson, who lived in Cardiff,
California, was 79 and had been in ill health for several years. According
to Gary Smith, VE4YH (proprietor of the VE4YH Virtual Swan Museum,
http://www.pcs.mb.ca/~standard/), Swan Electronics, then Swan Engineering,
began during the winter of 1960-1961 as a one-man operation with Johnson,
then W7GRA, building the first 10 Swan SSB rigs in a garage in Benson,
Arizona.

Swan moved to California in 1962 and became a subsidiary of Cubic
Corporation in 1967. Amateur equipment production continued until around
1979. In its heyday, Swan cranked out some 400 transceivers a month from its
Oceanside, California, plant. Swan also manufactured station accessories.

Johnson subsequently formed Atlas Radio, which produced solid-state
transceivers, including the popular Atlas 210. In 1995, a revived Atlas
Radio promised to produce a new-generation Atlas 400X and even collected
deposits and full payments for radios it ultimately failed to deliver or
which failed to meet expectations. Johnson conceded in 1996 that he had
"wandered into a mire of technical problems" in trying to design a new Atlas
HF rig. He said he personally lost thousands of dollars on the revived Atlas
Radio venture and estimated that as many as 250 hams had made deposits,

while only a few ever saw their money again. Many hams complained to the
ARRL, and a few sought legal action against Atlas Radio.

Other hams who invested in Atlas Radio also were left in the cold. In 1995,
a company called O.M. Radio struck a deal to take over Atlas Radio's assets
and manage the company. O.M. Radio also operated an Atlas Radio repair
service and even promised to make good on delivering the new transceiver,
but nothing ever came of the effort.

Please view my auction of an RG-99, FC-390, and D104M6B. Radio and FC390 are in excellent condition and in original boxes. Mic is in very good condition.

Thanks

>Now please tell me how the hell the police will confiscate his equipment?

By grabbing it. (they have the guns that make this possible)

>A palomar 350Z is a hf amplifier. Why would the police confiscate that,
>and for what reason?

Because they don't know what it is, or don't care anyways. They
don't have to. They CAN intentionally make a mistake by taking
your equipment and get away with it. They know that it is up to you
to get your equipment back, and this would most likely be to time
consuming and costly for you. Even if you do make a case that
the equipment should of never been taken/stolen in the first
place they know there is NO negative consequence of their
original action of stealing your equipment.

Conclusion: steal away

If it is one of the 46/49 MHz phones , the list below may help you figure out which frequency to use if you want to build a dipole. I suggest that you use a scanner, if you have one or can borrow one from a friend, and check which frequency your phone works on. Just turn on the handset and scan around until you hear a dial tone. These frequencies came from a scanner website, but I don't remember which one. If your phone doesn't use one of the frequencies, you may want to search the net for Cordless Phone and Frequencies.

Output Input
43.7200 48.7600
43.7400 48.8400
43.8200 48.8600
43.8400 48.9200
43.9200 49.0200
43.9600 49.0800
44.1200 49.1000
44.1600 49.1600
44.1800 49.2000
44.2000 49.2400
44.3200 49.2800
44.3600 49.3600
44.4000 49.4000
44.4600 49.4600
44.4800 49.5000
46.6100 49.6700
46.6300 49.8450
46.6700 49.8600
46.7100 49.7700
46.7300 49.8750
46.7700 49.8300
46.8300 49.8900

The new president Reagan radio will soon be available:
Features include a low price of $20, but your children & grandchildren will one day be sent a bill for $8,224.50.
The Manufacturer will promise SSB, mic gain & roger beep, but when you get it it's AM only with just a squelch control.....
The Mfgr will swear its made in the Phillipienes, but they secretly pay Iran & Iraq to build 'em...
After a few years the memory functions all go haywire & it never remembers what channel it's on.....
People on a limited income that leave a lay-away payment for one will never actually get one, instead each of their deposits will be applied against rich peoples purchases, making the rich guy's radio even cheaper.....

friend , it is my contention that your foolish attempts at political satire are of questionable worth at this time, wouldn't you say. to put it mildly , coming off of seven and one half years of having to put up with the most corrupt administration in american history, i myself remember fondly the reagan years and i say we need somebody like him now and soon. we do no need this idiot , gore or mr nice guy bradley. we need somebody that is ready to stand up at the plate and take a swing and if some people don't like it , too bad. most of the crybabies these days are people who live off of government handouts and are beholding to what uncle sam says. i think if you are getting government assistance you should not be allowed to vote, because it is a conflict of interest . now i know that is going to cause a lot of whining in the cb ranks. because there are a lot of cbers who buy into this bs and that is too bad. but not me. i say bring on the poll tax again. that is one tax i wouldn't mind paying . and if you can't come up with $25.00 to vote, you don't need to vote anyway. that way we weed out those who show up to vote for people who they think will give them the most, a most unsavory method of electing politicians, wouldn't you say, ...cd is out......

Greetings!

Well, If you're on the "board" for an association...

Then what are you doing here in a rec.radio.cb NG - just making it
worse for those that have these "Convenants"?

To me, this is a restriction of a freedom we all pay, and many have
died doing so, for.

I don't understand why one set of "antennas" is acceptable, while
another is not.

Are you guys that narrow minded?

Is it some kind of Ego trip? The Smiths' versus the Jones'es?

All because you, and others like you, believe property values will
drop like a stone because of ingrates?

Show me a CB'er that seems to fit the above catagories?

On Sat, 05 Feb 2000 00:18:10 GMT, while the modem was pondering it's
navel, "Hutch" <hutchg@earthlink.net> dissertated the following:

>Better double check the restrictions, the government mandated the mini-dish
>allowance but that does NOT mean that any other antennas are allowed! I
>know because I've been on the board of our association for 4 years. Just be

you can buy this antenna new still but the person that owns the rights to the Avanti line up will only sell single parts , so that means you will end up spending $200 or more on a ground plane , all avanti antenna parts are still around but very expensive .

Are there any variable tuners like a 468x in it check the output
combiner and input combiner Did you replace with same pills what
was the box doing before you changed the pills ....Check the
caps on top of the transformers one of them could be bad even though
the caps look like new they could be fried this happens a lot
since it is only doing half the power somthing on one side is out
make sure all connec. are good check the final output cap if its
bad it lowers power output key the box for 30 sec. check output
combiner to see if its hot let me know if you email me the
answers i ll help you fix it step by step BusDriver.............

hmmm, and what part of the country are they manufactured in and what makes them different than say , a davemade amp, perhaps you answer that question. to me they look like, nothing more, than another knock off of davemade. really , is it possible for one person in these united states to have a original idea , that they invented themselves. i , cd, do get tired of these amp guys coming on here and thinking that , they are going to make enough money to retire , from their newsgroup exploits. well , it ain't going to happen. not as long as there are free thinking individuals available to keep these money grubbers in check. and that is where the great , cd, comes in. so talk to the hand kaos. i shall not be moved,.....cd....out.....

hey pick a poo. let me explain something to ya. i am not this guy who you are talking about. now having got that out of the way, let us look at my discussion. it is reasonable to assume that someone who is trying to stir up business would use a ruse such as free bumperstickers to get his business started. i have no qualms with that. go for it. i am merely trying to point out that it does smell kind of , shall we say , fishy. that is all i am saying. so excuse my reticence at not excepting his wonderful offer at face value. i guess after 8 years of listening to clinton gore, i have grown , shall we say, somewhat skeptical. heck , the man is probably doing what he thinks is best. so whatever. i got a great idea, there pick a poo. why don't you get one of those bumper stickers and affix it to back of your little white pick em up truck. that way , it will look a lot better and you will call much more attention to yourself than you do now, especially while you are out there sitting on that guard post , keying up on channel 19 and squashing mudducks with that 16 pill ghostrider box, good buddy,.....cd is out.....

Dont even start thinking that Reagan was better than what we have now.
At least Bill Clinton can get a blow job! I would rather have someone
in the White House that acts like a real person that shows his fuckups
and tries to cover them up like a normal personal than have someone
that will pay his way to the top without earning it. We all know that
Bill Clinton smoked pot, He said he didnt inhale, We know thats
bullshit, But I still respect the fact that at least he admitted
trying it. Besides, Do you possibly think that George Bush will do any
good for this country? This country is going under fast and with a
Republican in the seat, It will just go down twice as fast. I used to
support the Republican Party till I noticed that my wages were crap
and I had no chance to be a respected part of my community. Now I make
good money and my business is well known, thanks to the democratic
party. Monica Lewinsky must have been a Republican, Because she
sucked.

487. Re: Another Antenna Question

Newsgroup: rec.radio.cb
Date: 2000-02-06 00:00:00 UTC
From: cobrano-spam@budweiser.com
Message-ID: <389d4cec.2536018@news.thegrid.net>
Source record: 23106

If they allow a TV antenna, Then they must allow a scanner antenna as well, since a scanner is not a means of communications in there terms. I would be the nasty neighbor in these parts if my community had these regulations. Put up 2-3 TV antennas and put them right in your neighbors view. You might also want to check with your local city hall and find out a few things. Is the streets in front of your house a city street or private? Is your area patrolled by the city police? If those above question reflect any city involvment, that is a plus. Also note that if they are city patrolled and owned and you own your home, you maybe able to put your antenna up. A home owners association is not LAW.If you signed a contract about any of the rules then your screwed but if not then you are OK. The best thing I can recommend is to get a new residence that don't have the HOA crap. The Home Owners Association is nothing more than another government telling you what you can and cant do. Also take a look at the FCC rules and regulations, They state that there maybe local city and state laws pertaining to restrictions in your area, but none stated for associations. Then go to City Hall and see if there are any restrictions in there rules that pertain to Home Owners Associations. Also note that, Since they allow Satelite Dishes and TV antennas, They are breeching your contract. With that in mind, Until another contract is written and signed, Communicate away.

Maybe I should have included the reason for this when I first posted this reply.

The initial reason for them pulling him into the scales was since the CHP run near 42 mhz, The driver was interfering with a California Highway Patrol officers radio. This inturn was there response. The FCC has never been the Sole enforcer in communications nor is the FCC a Law Enforcement Agency. All Law Enforcement agencies can and will confiscate radio equipment being used illegally when there is a surpassable amount of proof. If and when the case goes to court, That is when a FCC representive maybe involved. Note: Whenever an FCC agent wants to search your house, There must be some sort of Local Law Enforcement agency there to accompany them (City, State, County) to ensure reasonable safety.

In a short term: The FCC is not a Law Enforcement Agency. Only a service for communications and licensing.

Snorky, re:

>I have heard that the AM mod is different than the sideband mod. I
found a site that had the SB mod, but no AM only mod.

Nah... I got both of them--same mod, but just not as extensive the channel
results--which on a whole actually works out fine, since there's no-body on AM
that high or low anyway....

FWIW....
After the FCC stopped issuing numbers to CB'ers long ago, some entrepeneur got the bright idea to charge money and continue the process. Many years back I mailed in $10 to get an 'official' SSB call sign and a nicely scripted document proclaiming me one of the elite and righteous. Of course, the call sign had absolutely no credibility because there is no control system---the number could be used by anyone. Lately while surfing the Net I've noticed several similar 'games' come into play which are equally useless. Save your money

22JT, or whatever....

It's the same all over even on the personals. Someone posts about
being available just to string people along. So, you see its rampant
everywhere. We all get pissed when someone strings you along with
wrong information or lies.

Hmmm! Just my two cents Scott, it happens everywhere,oh on ebay too.

O.K. guys , I really appreciate your help .
Heres the details .
(1) The input resistors are good . although i had to replace them with wirewounds (original ones had broken leads) I was told the wirewound resistors would be fine , there was no change in performance when i put them in so I have to assume that it was ok to use them .

(2)The swr at the radio is only flat when the box is on high , (swr sky rockets on low and medium)

(3) yes , I took the cheap way out and didn't buy a matched set of transistors (I have seen a few discussions on this before and and people seem undecided on whether or not you need them) and I bought more than four so I went with the quantity discount .

(4) I used Toshiba pills , which is what came out of it .

(5) and I know it can't be the pills because the box did exactly the same amount of power before I changed them .

(6) I don't remember the combiners getting warm and i can't key it up at this moment . (nieghbors) I did feel around for warm parts and the only thing that got warm was the pills .

THANKS FOR HELPING ME WITH THIS GUYS , we don't have anybody in this area that knows what there doing so I have to repair my own equpment if I want it to work .
THANKS
BENZ

Along the lines of this, I have a question....I am a Tech, and would love to get to HF privileges, code was easy 20 years ago when I did 13 WPM for my first license, which I allowed to lapse. Since then it just ain't coming back... My question, and this is based in practicality, not any obtuse disparity between old school and new wave hams, is would I be better off waiting til April or hitting my 5WPM now for a Tech plus. Where is the big advantage, if any? Not really familiar with the changes in the rules.

email replies appreciated

509. Re: NEW PRESIDENT REAGAN RADIO.....

Newsgroup: rec.radio.cb
Date: 2000-02-06 00:00:00 UTC
From: twistedhed@webtv.net
Message-ID: <3748-389DA3B9-40@storefull-128.iap.bryant.webtv.net>
Source record: 23128

Fact #1: Inflation grew faster under the Reagan administration than any other presidency.

Fact #2: Government spending and pork projects were at an all time high during the Reagan years.

Fact #3: Violent crime was at an all time high.

Fact #4: The earnings gap between the rich, middle class, and/or poor grew fastest during the Reagan years. The rich got richer and the poor got poorer.

Fact #4: More cocaine was imported during the Reagan-Bush administration than the entire combined administrations of Nixon, Ford, Carter, AND Clinton. This was sanctioned and protected through Ollie's little covert ops.

Fact #5: More Americans were imprisoned for NONVIOLENT crimes during the Reagan-Bush era than at any other era in American History.

Fact #6: Americans were stripped of their privacy and rights to be free of government intrusion during the Reagan-Bush era.

Fact #7: Manuel Noriega was on the CIA payroll through the first 6 years of the Reagan administration and this was denied right up through Ollie's trial.

Ask yourself, are you better off today than you were during the Reagan-Bush years? The answer is an astounding 88% of Americans have more disposable income today as compared to the Reagan-Bush years. Yea, I will catch a lot of guff from you die-hard conservatives, but I too, was once a republican.
I worked since I was 14 years old and everything I have was earned by the sweat of my brow. I worked on Bob Martinez' campaign before he won the Governor's seat in Fla. I was a staff journalist for the Atlanta Constitution during the Bush years and witnessed first hand the most corrupt era in US history. George Bush was a high ranking official at Lilly pharmaceutical, appointed by Dan Quayle's father before his political career.(The Quayle family holds a controlling interest in Lily) He also was a member of the Skull and Bones Club at Yale, an elite, secret society whose sole purpose is recruiting for corporate espionage. The favor was returned when Quayle was appointed VP. I could go on.....but please don't talk about corrupt administrations until you have the entire picture. Yes, all the administrations have broken the law, but none so much as the facetious and callous Republicans that walked all over it's citizenry.

Power readings will be skewed with changes in SWR readings. .Power
readings should only be believed with a 1:1 match or with a dummy load
attached.

> ....will power output on the meter change if i
>got it down to 1.5 across the board or is only radiated power effected? whats
>normal output on unmodified cb rig?

A 2:1 match will show either twice the real power on a typical power
meter or it will show half as much as the real power. It depends on
what is causing the mismatch. Never measure power without a good
match first.

A stock CB at a good match, should be between 3 and 4 watts
carrier. This same stock radio will make the meter wiggle a little bit
with modulation.

From the mic connector the audio wire goes to a 2pin jumper that plugs into
the CPU board.
If I pull this plug I receive Side Band and it is still is TX mode.
But now I'm not putting out a carrier because I'm in side band.
It is still displaying 26 meg. I cant change this since I'm is TX mode..

Did I fry my CPU?????

518. Re: swr vs power output

Newsgroup: rec.radio.cb
Date: 2000-02-06 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <389dacca.53163672@news.iserv.net>
Source record: 23137

Greetings!

What you are seeing, is the power the radio produces, *before* it gets
to the antenna.

In some installations, the POWER meter would show different readings,
and since most power meters show AVERAGE power, you see a power level
that is not always accurate.

For best results - use a dummy load on the output terminal on the
power/SWR meter that goes to the antenna, and check the power output
again. If it's different, there are number of reasons for it.

Pretty much all CB's should show 4 watts minimum power on a resistive
dummy load of 50 ohms impedance.

The easier way to see any power increase is to use a Field Strength
meter. You can see the antennas own ability to radiate power change by
adjusting the antenna. When using the F/S meter, you can obtain a
considerably large increase in Effective Radiated Power, or ERP - by
adjusting the antennas ability to absorb power by using the maximum
Forward Power indications.

Another option would be, and if you want to experiment, is not to
adjust the antenna using the reflected setting, you use the FWD
setting...

Please note!
This is only an experiment to demostrate, I cannot
be held responsible for any damages that occur!

Proceed with caution...

Set the antenna whip, tuning coil, stub, to a position you can easily
remember...

Install the SWR meter...

Using the FWD setting, note and set the meter to the maximum CAL or
SET indication on the meter.

Then check SWR, if it's less than 1:3...proceed with this
demonstration...

Adjust the whip/coil to another position...

Set the SWR meter back to FWD setting, and re-check the
calibration on the FWD setting without moving the knob.

Did it go up or down? [we're checking FWD reference]

Usually when an antenna is mis-tuned, the radio *attempts*
to reduce power - because it senses a mismatch.

If it went up, re-check the SWR...using the REF setting...

If the FWD reading went down, scroll down to ---DOWN---
section...

Did the SWR go lower - e.g. 1:2.5 or less?

This would indicate that the antenna is now loading the
system [radio, coax, antenna] more efficiently.

Re-adjust the meters CALIBRATE knob to bring the meter
needle back down to a safe area to prevent overswing and
possible damage.

Adjust the whip/coil/stub to a different length and
proceed with above steps. Check the SWR during these
times - to ensure the antenna is not showing a high
SWR mis-match.

There will be a point where you can't get any more foward power
increases in the FWD setting on the meter. It is a good idea to check
the SWR, and if it's not dangerously high [less the 1:2], you can
leave the antenna set like this and have no problems.

---DOWN---

If the FWD reading and SWR is lower, can be indications of other
reasons why this occured...

Antenna not located in a spot that can provide good
resonance on the vehicle or area.
[Actual SWR at meters location in coax should be re-checked
using a patch cord of different length]

Coax problems...poor coax, mount not installed properly,
Coax not grounding to the antennas location.
[This can occur with Mag-mount types of antenna setups,
you'll have to settle for what you get.]

Radio output network may be mis-aligned. The radios own
impedance matching network to match the finals output
impedance to the expected 50 ohms the antenna can provide,
is not working properly.

You may be viewing a coax impedance transformation event,
where the antenna and the coax alter the SWR meters FWD
settings because of the voltage wave present at the meters
own location within the coaxial line is different.
[This means that the coax and antenna are not a true SWR
match - the impedance of the antenna is different than the
coax - and the coax is showing the impedance *it* sees at

that point along the line.]

On 06 Feb 2000 13:58:28 GMT, while the modem was pondering it's navel,
mathjak@aol.com (MATHJAK) dissertated the following:

>when using a combo swr/power meter is the power output shown regardless of

Source record: 23138

That depends on whether the linear has tuned input or not. Check the VSWR between the radio and the amp. If it is too high it doesn't have tuned input. In that case you can still use it without damaging your radio by using an antenna tuner between your radio and amp to take place of the tuned input network and give you a better match. At 4 watts output from your radio you don't have to buy an expensive tuner either, one of those inexpensive ones Copper sells should do just fine.

Go with an Ameritron AWM-30. It is accurate, has 300 and 3KW ranges, is cross needle movement so it displays VSWR simultaneously with wattage, and best of all....it is a true peak (PEP) reading wattmeter.

Lloyd,

Ever since you posted this I have been searching the net for an article I came across a few months ago. If I ever find it, I will post the URL. Since I haven't been able to find it, here's the basics of what was happening:

A long time ham operator retired and moved to Florida where he bought a condo. When he signed the contract, he wasn't aware that the CCRs didn't allow for an antenna of any kind (even TV or satellite). Now, I'm not saying that you should do this, but I would: After he'd tried getting the CCRs changed and failed, he installed his antenna anyway, given it was only a short wire antenna. The issue had since gone to court. The Home Owners Association couldn't remove the antenna without propelling the case into federal court. This has already been in the courts for about 2 years and has cost the guy a pretty penny.

Like I said, this may not be the way you want to go. But if nothing else works, give it a try. Of course, before doing that, you may want to take a stroll around to most of your neighbor's homes and explain your situation to them and ask for some support. It helps if you tell them that if for some reason your CB messes with any of their TVs or radios, you would be more than happy to work up a solution as soon as they notice it. If you persuade enough people that there is no harm in having a CB antenna, then they'll probably be plenty happy to sign a petition to your HOA or even drop by one of the meetings and put in a good word for you.

Good luck!

P.S. If something happens, let me know.

Sometimes the Ebay 'FA" posts are a help. The reality is that FS posts on groups, especially here, are few and far between. Most of the replies end up being dead ends, or flames about your prices, and don't generate much of a response. If I want to sell something, and don't want to spend time dealing with tire-kickers, I put it on Ebay, because it sells.

I sometimes will put a link here for something on Ebay because the average guy doesn't want to spend hours sorting through the 10 zillion ads in the hopes of hitting what he wants, but if he sees a posting of a link directlt to that elusive "Zoomafritz 2000 Gold XLR" rig, he can click and go, and if the price is where he wnts to be, he bids. The "FA" heading allows those who don't care to participate to go on to the next posting.

Just my 2 bits worth...

Excellent points! Although I believe you are incorrect about there have
to be local law enforcement agents present during FCC station
inspections. Although it may be common practice, I don't believe that
it is required.

Stay away from sweep tube amplifiers (ie: 6LQ6 tubes) as these tubes haven't been manufactured in a long time and are getting quite expensive. 811A's and 572B's are very good tubes as they were designed for RF amplification to begin with (unlike sweep tubes). I've heard of some problems with the Ameritron AL-572 so I would pass on that particular amp if you happen to come across one for sale.

My take on this is that the FCC is increasing its concentration on interference to 'other services' outside the '11 meter CB' band. The new director has vowed to persecute those who operate CB outside the CB channels. He is also wanting to do away with 'shortwave pirate broadcasts'. As for what goes on inside the CB band, it will probably be left mostly alone.

Very simple smart Guy. First you measure the power available at the transmitter by using a power meter directly terminated into a dummy load. Then you attach the feedline under test to the transmiter, and at the other end of the line you attach the watt meter and load. The difference between the two readings is the line loss. Gee now wasn't that hard. Now smart Guy I would spend somemore time and teach you how to change the resultant figure to a Db gradiant But I don't think you could do the math.

So what's wrong with that? I like to ball bust while I'm out. I like it better when I'm on two meters. I have my radio equipment to have fun with. I mostly just listen, but there is ALWAYS someone out there that needs a bit of teasing. I don't really care if I get flamed for that or not. Nothing wrong with a little harmless ball busting, but that's just my opinion.

Regards,
Jeff

I have been on the CB on and off for about 17 years. I have NEVER had a "40" channel radio until just recently. When I read this message it made me want to have my radio modified. The FCC doesn't have the manpower to do anything about "outbanding" I don't run illegal power anymore, but I think that's just an ago trip anyway. Modulation is what gets you heard. I have no desire to shoot skip and never really understood what the fuss was all about. If I wanna talk to people far away, I'll use my computer and the internet. My CB is used to harass truckers on the way thru town and harass the locals a bit. Occasionally, we discuss serious things, but it is a great source of laughter for me. If anyone out there has been to the Niagara Falls NY area, you'll know what I'm talking about.

YOU tell them! What also needs to be said is that Reagan was the biggest Communist in Hollywood, as exposed by Myron Fagan in the 40's. He only "turned" after he met Nancy. The problem with Regan is that he permitted the currency to be further debautched in '82 by taking the copper out of the pennies. Dummy/Commycrat Johnson did worse in '65 when the silver went out of the quarters, dimes & halves. Basically because of the sins of the people, we have a BIG mess today. 2 Chron. 7:14 IS the answer. I can make a better story for a clinton CB. It shoots you out of the sky if you go against his UnConstitutional dictates in da PLL section if you say you will expose him (Ron Brown) and it will cause your kids to get Murdered on train tracks in Arkansas, and it even has a "Bully" button that if someone tries to impeach him, that the CB will "talk back" & BULLY the owner until you give up! Also it has a button to give you another wife or an Adulterous "affair" IF your wife wants you to get off the CB & do your Honey Housework!! The brand name on this CB is blurry, because since they allegedly got rid of the 10 Commandments, everything is relative in their wishy washy world & the clinton CB may really be an AM/FM stereo! Also has an on/off button that you can't tell when you are ON or off - they took out the "light" of the (CB) world pursuant to Romans 13! Not to mention a Drug dispenser (pill dispensing CB), all the money that you put into it, allong with supporting the Bush camp-pain will buy drugs to support the cia! Now if dey stopped Cigars comming in from Cuba in '59 or so, then WHY can't they STOP the drugs? Dey is profiting BIG time from dem, and GOD is watching them in a spiders web over a lake of fire, ready to cut the web @ the right time IF they don't repent of their evil ways! IF we repent, then GOD will HEAL the Land!!!!!
Dave!!!!!!!!!!!!!!!!!!!!!

Here is a copy of what I sent back to you In reply to YOUR Mr. Smartly Pants Email to me (a ad from copper) I don't see how this makes me a rip-off. Lets tell the full story sonny boy, and then let the group decide then.

==========

So what's you point? If you want to buy from those asses go ahead. It's because of penny pinching dick heads like you, that There aren't hardly any local CB shops anymore. So I'm trying to make $10.00 on a sale. What's so bad about that? There're are plenty of places that try to sell the same antenna for $69.00 or more. If you ever get off welfare and start your own business you might understand that you do have to make a profit if you want to stay in business. In the mean time keep your internet price police opinions to yourself.

What happened to Solarcon, the makers of the A99. They have no listed phone number in Holland, Ohio.
Have they moved or gone out of business?

The last three A99's I got in stock have No instructions with them. One was defective out of the box.

What's the deal?

548. Re: NEW PILLS , NO LUCK

> O.K. guys , I really appreciate your help .

No problem... Not let's get your box working...

> Heres the details .
> (1) The input resistors are good . although i had to replace them with
> wirewounds

>>>Bad idea. The resistors have RF going through them , and a wirewond resistor is nothing more than an RF choke. Pull them out and get some nice 3 watt CARBON COMPOSITION resistors... Nothing else, nothing less. This, alone, could be a major leader of your problem.

(original ones had broken leads)

>>>You couldn't just file back a bit of the resistor to get to the wire to resolder them? In a pinch, I have had to do this, and it works fine for the relatively smallish amount of current going through the wire.

I was told the wirewound
> resistors would be fine

>>>Whoever told you that was an idiot, to be blunt.

, there was no change in performance when i put
> them in so I have to assume that it was ok to use them .

>>>No, don't. Pull them out and

>>>A. Discard them. Your 4 pill should at some time have a small driver put in front of it for AM use, and a good SSB radio will drive it fine

>>>B. 4 pills doesn't REALLY put out that much power, and hey..... what is 600 watts among friends!

>
> (2)The swr at the radio is only flat when the box is on high , (swr
> sky rockets on low and medium)

>>>Could be due to the resistors you put in. On high, there are no resistors in line, so they wouldn't play that much effect on total circuit impedance... Once you start putting them in line, you will run into problems (And you are putting them in line when you start switching gears).

>
> (3) yes , I took the cheap way out and didn't buy a matched set of
> transistors (I have seen a few discussions on this before and and
> people seem undecided on whether or not you need them) and I bought
> more than four so I went with the quantity discount .

>>>Too bad. When running an amplifier that has bias on it, you should get matched sets. When running a Class C battle box, I STILL run a matched set, but it isn't totally necessary.

>>>You get what you pay for.

>
> (4) I used Toshiba pills , which is what came out of it .

>>>Good.

>
> (5) and I know it can't be the pills because the box did exactly the
> same amount of power before I changed them .

>>>Here is the million dollar question, that peekaboo (Hi Peek) should have asked you before...

>>>WHAT KIND OF WATTMETER ARE YOU USING?

>>>If your using a averaging or RMS meter, you are seeing about what that amp will put out. If your using a Dosy or other PEP reading meter, then your way low on output.

>>>An RMS meter reads approximately 1/3 of the PEP value... Take 190 X 2.828, and you have 530 watts of RF output, which is about what the old Magnum 4 pill 2879 box did.

>
> (6) I don't remember the combiners getting warm and i can't key it up
> at this moment . (nieghbors) I did feel around for warm parts and the
> only thing that got warm was the pills .
>
> THANKS FOR HELPING ME WITH THIS GUYS , we don't have anybody in this
> area that knows what there doing so I have to repair my own equpment if
> I want it to work .
> THANKS
> BENZ
>

Not a problem. Hope this helped.

Probably because it's a illeagal non-type class accepted Amp smart guy.

Wrong, asshole.

All the Palomar amps that came from Escondido California where legally
offered for sale, with the blessing of the FCC...

They where marketed before the rules stated that they couldn't be capable of
transmitting on the 11 meter band.

Guess you better go learn some CB trivia.

Occasionally you will have to give the alternator a "kickstart" of about 4 volts on the field to get it to start producing current.

Thank you for the info. Since I never had a problem before and they didn't supply any instructions with the units, I didn't have any contact information. When doing a search for them on the web, I can only find dealers and distributors. I have been unable to find a website for the manufacturer. I'll give them a call Monday. Apparently, someone is asleep in their boxing department and is not including the instructions.

The middle section of the antenna that was defective wasn't threaded. It wouldn't screw into the bottom section. (No, the customer didn't cross-thread or damage this one. It was obviously that way from Solarcon.)

I find it strange that the amp has an odd number of transisitors? That amp is probably capable of 1200 to 1500 watts average. That means that it probably needs about 120 to 150 amps of current. That is far more than most vehicles can produce with an alternator. HOpe this helps.

John

I think you're wrong, Sunny! Both Clinton & Bush have been getting the drug money kickbacks to fund the ciA since the 60's. Mena Ark. IS the big drug airport. I'm not fond of the Republican Communists OR the Democrat Communists. They HIT you from one way, to make you go a third way. Thesis, antithasis, Synthasis.

The President's ONLY JOB is tho enforce the laws of Congress. That's ALL ! Not his job to buy you a CB; nor his job to act like a Biblical "King." He has NOTHING to do with the economy. This is a self made job UNConstitutional "job" from them since '71, when Nixon debatched the currency further for going off the Gold standard. I remember then it was "President Nixon's NEW economy." (What happened to the old one, which lasted from 1787 to 1965? Read Rodger Sherman from Conn. on how prosperity came back FAST after the revolution (1787). I know a guy in a town that has been studying this for over 50 years that HAS the answers. He has made himself known, Congress doesn't listen to him because we but we are controlled by European bankers in an UNconstitutional national bank that have caused ALL of the economic problems since 1913, including the depression of '58 which slowed American CB radio production. Executive orders & BAD Judges have RUINED the nation, because of THE PEOPLE's SINS. Only a miracle from God will save us pursuant to 2 Chronicles 7:14. Keep the 10 Commandments! Can I have a BIG 10-4 on this, Hand, or should I say Head? Did I UN-twist your head a little? You witnessed the 2nd most corrupt regeime in US History. The evidence is in--Clinton beat them with a 20 kw Satan -Made CB liniker!!!! How much Communism did you see in Atlanta? Is that paper owned by Fonda/ Ted Turner? Did you find him/her to be "fine" "Americans?" Dave!!!!!!

twistedhed@webtv.net wrote in message <3748-389DA3B9-40@storefull-128.iap.bryant.webtv.net>...
Fact #1: Inflation grew faster under the Reagan administration than any other presidency.

Fact #2: Government spending and pork projects were at an all time high during the Reagan years.

Fact #3: Violent crime was at an all time high.

Fact #4: The earnings gap between the rich, middle class, and/or poor grew fastest during the Reagan years. The rich got richer and the poor got poorer.

Fact #4: More cocaine was imported during the Reagan-Bush administration than the entire combined administrations of Nixon, Ford, Carter, AND Clinton. This was sanctioned and protected through Ollie's little covert

ops.

Fact #5: More Americans were imprisoned for NONVIOLENT crimes during the Reagan-Bush era than at any other era in American History.

Fact #6: Americans were stripped of their privacy and rights to be free of government intrusion during the Reagan-Bush era.

Fact #7: Manuel Noriega was on the CIA payroll through the first 6 years of the Reagan administration and this was denied right up through Ollie's trial.

Ask yourself, are you better off today than you were during the Reagan-Bush years? The answer is an astounding 88% of Americans have more disposable income today as compared to the Reagan-Bush years. Yea, I will catch a lot of guff from you die-hard conservatives, but I too, was once a republican.
I worked since I was 14 years old and everything I have was earned by the sweat of my brow. I worked on Bob Martinez' campaign before he won the Governor's seat in Fla. I was a staff journalist for the Atlanta Constitution during the Bush years and witnessed first hand the most corrupt era in US history. George Bush was a high ranking official at Lilly pharmaceutical, appointed by Dan Quayle's father before his political career.(The Quayle family holds a controlling interest in Lily) He also was a member of the Skull and Bones Club at Yale, an elite, secret society whose sole purpose is recruiting for corporate espionage. The favor was returned when Quayle was appointed VP. I could go on.....but please don't talk about corrupt administrations until you have the entire picture. Yes, all the administrations have broken the law, but none so much as the facetious and callous Republicans that walked all over it's citizenry.

Yeah...

And to get that out, the rework would require a voltage doubler in the power supply as well as a new bias circuit!

Thanks for the info Toll . Deep down I didn't think I should have used those wirewound resistors , and I was going to get a matched set but i changed my mind , live and learn I guess.
I've had the box on both a dosy and a palomar . both of them saiid the same thing 100 swinging to 180 . I got 300 PEP out of it with a 10 swingin 100 driver .
(just to eliminate a diagnosis) I ran 4 ga wire into the box , bypassed the internal fuse , scraped the power traces and built them up with solder , and the pills are strapped . so I have eliminated the possibility of a lack of power .

Bill

Sorry, but that wouldn't be correct.

If it was 1 into 7, it would do exactly as he says....

However, with 8 tubes, the anode current would be so great that the plate impedance would be near 50 ohms!

I think the story is bullshit.

Also, 4X811A do 800 watts PEP all day long.... 8 would do 1600 to 2000 without much of a problem!

Its not required but most FCC types will request some HEAT since the FCC
doesn't carry weapons and don't like to be exposed to danger. Be
forewarned, the FCC Agent is a Federal Agent and is protected by Federal
Law. Police presence is just for safety sakes.

Most State Police and Heavy Motor Carrier Regulators have been
guidelines on CB/AMPS. see my earlier post. Some states are entering
into MOU (memoranda of Understanding) with the FCC to allow for radio
inspections, especially on the Trucking Industry. The FCC has issued an
instruction booklet and has a duty officer if a question arises as to
what the officer is dealing with.

You wrote....

"Excellent technician and experimenter? Yep"

Then, you wrote

"Each is self published and absolutely RIFE with errors, redundancies"

And

"Cheek is nothing more than a hack (NOT a hacker, he hasn't the
expertise). "

So, which is it?

You say he is an excellent tech, then say he is a hack. You also say that
he is borderline sociopathic..

Well, I guess that being called a borderline sociopath is nothing, coming
from a two faced pile of shit schizophrenic, eh?

Fuck you. Bill is a good person, and yes, his eventual death will be a
bummer to the CB radio, Pirate radio and scanner scene. He was one of the
people who challenged authority, yes... But, he never stepped over the
bounds..

And as for you bitching about how people don't answer YOUR simple questions
for free.... Well, I guess you also expect the farmer to GIVE away his
produce, GM to GIVE away their vehicles, etc., etc. ,etc....

As you went on to say in your personal rant... Bill's radio knowledge was
and still is his bread and butter.

Get a fucking job, a charisma and a life.....

Toll Free
Getting personally bent out of fucking shape by a selfless pile of shit.

Why? I can get a AB amp to modulate 25% Low dead key with 75% of swing works as a modulator for me

A outfit in Italy make these amps and there supposed to be really good. They use a EL509-519? I never heard of it.

And there very exspensive to boot. I would shop around first and you may find one somewere else, if not Peter would have what you need. I just got my plate xformer for $150.00 and Peter Dahl wanted nearly $500.00 for the same one. It helps to shop around.

Or perhaps someone who doesn't understand squarewaves built it with 1
driving 2 driving 8. In any case, you'll need quite an electrical
system to run this.

Good luck

594. Stupid CB Tricks - The E-Mail List

Newsgroup: rec.radio.cb
Date: 2000-02-06 00:00:00 UTC
From: Stupid Scanner Tricks <stupidscannertricks-subscribe@egroups.com>
Message-ID: <389E3B9F.4BA6@egroups.com>
Source record: 23262

Stupid Scanner Tricks.com is proud to announce the expansion of its ever popular, feature rich, e-mail list into new fields of interest.

With the sucsess of our 1100 member strong scanner list, we've decided to tackle the other radio markets as well, bringing the fun back into the hobby in a public forum. Say goodbye to the spam littered, content-free postings of the newsgroups. Don't worry about being flamed for posting a "dumb" question. Human moderation of the groups means only the top posts get passed on to the group - not the "Me Too's".

Visit http://www.stupidscannertricks.com/elists/ for more info and subscription forms or just send a message to the e-mail address listed below to be automagically subscribed.

These E-Mail Lists Are:

- Moderated
- Available In Digests
- Readable On The Web
- Better If You Contribute
- A Great Way To Promote A Related Product Or Service
- Free!
- Informative For New And Old
- Set Up To Let You Poll The Group
- And Have Browseable Archives

Stupid Scanner Tricks
stupidscannertricks-subscribe@egroups.com

The Best "Never Been Stumped" Scanner E-Mail List. Professionally moderated to stay on-topic and quench any flames. Plus press releases, product announcements, and special offers for and from members of this list. With 1100 members and growing, this list can generate a lot of incoming E-Mail (Hint: switch to digest mode)!

Stupid Ham Tricks - NEW LIST! Get In Early!
hamtricks-subscribe@egroups.com

People With Ham Radios Love To Talk. Otherwise they would have just bought a scanner. :) Join this list for your club and you can announce your ham swaps, testing schedules and workshops, and swap war stories.

Stupid Shortwave Tricks - NEW LIST! Get In Early!
shortwavetricks-subscribe@egroups.com

Learn A New Language The Hard Way! Tune into local or foriegn language radio programs from all over the globe. Now you can finally share your

tips and tricks with others who enjoy listening to the same programs you do! Join the Stupid Shortwave Tricks list today!

Stupid CB Tricks - NEW LIST! Get In Early!
stupidcbtricks-subscribe@egroups.com

Those Ham Radio People Got You Freaked Out? Get a CB and join this list to learn how to get the most out of it. 10-4?

Stupid Electronics Tricks - NEW LIST! Get In Early!
electronicstricks-subscribe@egroups.com

Heck, Anyone Can Use A Radio. But how many people can build one from scratch? Get nifty electronics tips, tricks, and ideas. Find out how to get started and come back for help.

Hey! Advertisers and Developers - READ THIS! We allow one free posting a month per comapny for related products and services and two two postings a month for new product announcements - delivered directly to your target audience's e-mail box for free. Need more exposure? We can consistantly deliver over 130,000 impressions a month on our e-mail list alone. Need even more exposure? We have banner ads, banner exchanges, e-mail co-branding, and free links listsings (with star ratings, popularity rankings, and reviews!). Visit http://www.stupidscannertricks.com for a look at what we offer.

Source record: 23263

Ok this all make sence, but the setup used here is was for a 900 Mhz cordless phone, what did you use to transmit at that frequency to get your results? The phone? We are talking very, very low power. Now if your goal here is to try and make me believe that you are a super smart guy, give it up. If I thought you were as smart as you are trying to appear I would give you the upmost respect, but it just seems to me that you are trying a little to hard to impress someone. Now I know that line loss a 900Mhz can become a problem when we are dealing with poorly shielded coax and lossy connectors, but we are talking about cordless telephone here. The story you are telling us is probably true. BUT why the hell would you want to go through all of that trouble to extend the range of a cordless phone, You could have achieved a good amount of range by simply using 9914, man you got more money in the coax, and antenna than most cordless phones are worth. What did you do your measurements with a 100 miliwatt slug?

"Antenna Warehouse" <kingpopXXX@cis.net> wrote in message

I could give a rats about what you could show me, I did not ridicule your claims, only how you posted them. 90% of the people on this group don't relate to "DB" simple laymens terms would do. Oh yeah if you are are so concerned with loss (as mentioned in another post), how come you sale those two watt look alike antennas with those crummy 3/8 24 stinger adaptors on them to adjust the stinger, those things will not hold up very long with some big watts going through them.

Yea, you are right. I shouldn't have done it. He didn't say anything,
just sent a email with a ad from Copper's web page attached. He caught
me off guard, and I acted rashly. I apologize. I don't think however
that him posting this warning and calling me a rip-off was justified
though. Maybe a hot headed SOB but not a rip-off. ;~)

I have always had a hard time with this concept of having to take
abuse just because your in business. I will learn from this experience.

Sincerely

kingpop

Use some small solder sucker braid. Press down on the pin with the tip of your tiny soldering iron, with the braid in between. After a couple times you will have taken 95 percent of the solder out from under the pin. Then gently prise it up with a dental pick or some such small probe. Possibly you will have to touch it with the iron tip while you prise it to make it let go. Make sure you use +5v from the cap, don't go to the regulator----it's a ways away and you will have a big problem if the wire touches something on it's way. Beware some of the Radiotech books have the HR2510 color plate transposed to the HTX100 page! Look to the HR2500 page in the edition 8 for the right drawing.

About the biggest problem I have ever seen with a mag mount is that when you run power it may burn the paint if the SWR's go all screwy.

: meter. You can see the antennas own ability to radiate power change by
: adjusting the antenna. When using the F/S meter, you can obtain a
: considerably large increase in Effective Radiated Power, or ERP - by
: adjusting the antennas ability to absorb power by using the maximum
: Forward Power indications.

Yep. And this maximum radiated power may not be where the VSWR is the
lowest. You get maximum radiated power when the antenna is resonant.

Well then. Think of this newsgroup as the CB band. What do you do on the CB? More than likely, assuming you have a life, you talk about anything and everything that comes to mind. I believe I am correct when I say all of this. So, if you wish to be STRICTLY on "band" perhaps those on the ham radio newsgroups would be interested.

I myself thought the post was humorous. Then this is assuming you have a sense of humor. Oh well, your post itself has nothing to do with CB radio, just bitching. Dont they have a "band"/newsgroup for that sort of thing?

Yeah, I said it...

Message-ID: <20000207025909.04639.00000624@ng-cv1.aol.com>
Source record: 23209

I was wondering if anyone knew of a mod to add FM to the Midland 79-290. When I did the channel mod, it added FM to the LIST of modes, but it doesn't actually enable it. Since FM appears after LSB when hitting the mode button, I can only assume that this radio is ABLE to do FM, but the channel mod doesn't enable it...

Any info you have, please email me at 2ld751@usa.net. Thanks!

Andy, 2LD751/NA031

Ok here we go again. #1 I used my P.C. electronics TX33 ATV transmitter to perform the aforementioned cable loss test. Although I could have used my Marconi 2017 signal generator also. #2 I am not trying to impress you, I am answering your questions and correcting your misstatement. I am answering/correcting them in the sarcastic tenor I am because that's the way you are posing them. #3 Where poor shielding certainly can and does cause loss, the predominant mode of loss at this frequency is dialectic loss. #4 The problem with using PL259/SO239 connector combination at these freqs. is due to the fact that they don't maintain a 50 Ohm impedance. We can get away with them at lower freqs. because the electrical length of the discontinuity is not significant. At 900 MHz. the 3" over length of the PL-259/SO-239 combination is a very significant portion of a wavelength (over a 1/2 wave) this causes huge standing waves. The rule of thumb for RF design engineers is that impedance discontinuities like this can be tolerated as long as they don't exist for more than 1 degree of electrical length. #4 This whole project cost me $25.00 for the Discone antenna which I already had. The LMR cable was free. It was sent to me as a sample a few years back when it was first being marketed. As a project manager for a antenna manufacture I was always being sent freebies by manufacture's reps. I under took the whole project because I like to see how far I can push technology in other than a brute force manner. It's just the way I am. Inquisitive type. #5 I used a 5 watt slug.

I am growing weary of this thread, you can have the last word. If our post should cross paths again, I would be more than happy to maintain a civil tongue if you will.

I used it because I had it setting around. It had been sent to me as a sample when this type of cable was first developed a few years back. It is spec. up to SHF. It's cost/size/loss characteristic were idea for this "just fooling around to see project". I didn't want to spend any money on this because I just wanted to see what could be done just for the sake of doing it. I do a lot of that kind of thing, no real reason to know I just want to know.

The exact cable is LMR 240. Times has a free handbook on their products, you can request one by going to:

An appeal to Monitoring Times readers and friends of Bill Cheek:
Bill Cheek, editor of the "Experimenters Workshop" column in Monitoring Times and author of a series of books on scanner modifications was just diagnosed with incurable lung cancer at the end of September. If treatment is not begun aggressively and rapidly, doctors give him about 3-4 months.

Bill says, "research on lung cancers is ever on-going ... My doctor said that even a year ago, my case would not have been treatable at all. Now they can offer me a 4-6 months extension." The problem is, Bill does not have medical insurance. He is self-employed at Comtronics and has two daughters in college. Furthermore, charges brought against him in a New York federal court last spring -- related to his scanner business -- are currently being heard before the Grand Jury.

Bill intends to fight the cancer, but he could use your help. Bill welcomes your prayers on behalf of him and his family. If you have knowledge or feedback on the latest cancer research and developments, Bill would appreciate hearing from you.
Expressions of concern are welcome, but he'll have little energy for personal replies.

You can also help with your contributions. A trust fund has been set up by friends and family to which you may contribute toward medical expenses. Here are the details:

Contributions for Bill Cheek can be made through Union Bank of CA. Checks can be made out to either:
> Bill or Cindy Cheek
> Cynthia Cheek trustee for William D. Cheek, Sr.

Funds should be sent to:

Union Bank of California
Acct# 0771354719
8359 Mira Mesa Blvd
San Diego, CA 92126
Attn: Rhonda or Kevin Smith (619) 230-3800

OR

Bill and Cindy Cheek
PO Box 262478
San Diego, CA 92196

Though always a controversial figure, there is no disputing the fact that Bill has devoted his life to the love of radio and technology. We at Monitoring Times ask that you give this appeal the widest circulation among your radio friends. As fellow hobbyists, let's show our appreciation by giving generously.

Handy Andy,

How would my being here make it worse for anyone with these covenants? Also, people need to realize that, 99% of the time, the homeowners association did NOT write the covenants, the builder did. The homeowners agreed to the covenants in writing when they purchased the property. The HOA only helps to enforce what the owners agreed to upon purchase of the property. Renters should understand this and, if they don't like the covenants, they should not rent in that neighborhood.
We are not narrow minded and this is not an ego trip. Most associations with covenants against antennas have restrictions concerning any type of outdoor antenna. It is the government that overrides these restrictions to allow "mini-dishes" and certain ham radio antennas. If you want to consider anyone narrow minded, it should be the government, not the homeowners association.

I have a ham license and enjoy CB's and shorwave listening, too. I have to figure out ways to do this without violating the covenants of my neighborhood.

I don't understand your comment about "ingrates"; who said anyone was an "ingrate"?

Also, convenant enforcement is a very small part of the homeowners association's responsibility. Most associations are made up of volunteers, and we do many wonderful things for our neighborhoods. Anyone can volunteer and have a voice in what happens in their neighborhood.

Regards,
Hutch

Cross-posted to: rec.radio.swap,rec.radio.cb,rec.radio.amateur.equipment,alt.ham-radio.vhf-uhf,alt.ham-radio.marketplace

I have for trade, a 4x SCSI CDRom Writer 4x write and wish to trade
for a:
Uniden/President HR-2510
Galaxy All-Mode Export radio
or a
Kenwood TM-441 or TM-541.
Radio must work excellent and look ok. Cosmetics are important but
minor scratches or normal wear is ok. I have 2 of these drives and
only need one of them, thats why I am getting rid of the other one.
The drive was tested by reading/writing and works great. I dont have a
manual or cable for it but it was detected by Windows 95 without
special drivers. I may be able to include an Acculogic ISApport SCSI
card with it, but do not know if the card works or not. The card has a
floppy drive connector on it also. I will ship drive immediately upon
receiving radio only.

Do you think you might have what Im looking for?
All inquiries will be answered.
E-Mail me at: cobrano-spam@budweiser.com

Source record: 23222

I'm in the market for a CB for traveling purposes primarily. I don't need too many bells & whistles and am thinking about the PC66XL. I am not interested in any noise toys or things of that nature, but I am interested in having the output power turned up a bit if possible. I see many posts about "having the right person do the mod". Who is good? How do I know? What about these places that sell the radio "already tuned up"?

Also, what does this do to the warranty and the life expectancy of the radio?

Any help would be greatly appreciated.

Hutch

If you mean 'unlocking' it so that it tracks receive on transmit, very easy to do. This is from memory from years ago...

(If you can't follow this, then DON'T TRY!! Either find someone that can understand this or get detailed instructions!)

I don't have a schematic in front of me, but just 'lift' one end of the diode that feeds the voltage from 'fixed' pot on the main pcb for TX frequency. Then 'lift' the resistor that feeds the front panel clarifier that TAKES power from the RX circuitry. I now feed that resistor with the REGULATED (I think 9v, but it may be 8v, it's been a LONG time!) from the PLL V+.

Do NOT feed the clarifier with anything other than this REGULATED V+ for the PLL. If you do, it will NOT be stable and you will sound like Donald Duck.

If you 'extend' what the clarifier can do, then it's more complex, but 'basically' the same. Too many idiots just try to 'take out' the resistors
that limit the clarifier. To do it right, you need to have a good clean regulated voltage source and then put in either a multi-turn pot OR two pots, one for course and one for fine tune. THAT I'm not going to describe here!

631. Re: upd858 PLL extra channel mods anyone?

Newsgroup: rec.radio.cb
Date: 2000-02-07 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <6GAn4.8489$563.388667@newsread1.prod.itd.earthlink.net>
Source record: 23229

As far as I know, the uPD-858 was first used in the Radio Shack TRC-152 CB set, which was introduced when Radio Shack ran out of TRC-52 radios still in 23 channel days but almost a year before 40 channel was available.

At the time, the FCC had originally declared that CB would go 99 channels wide, but then immediately backed off from that. Before they announced how wide it would go, manufacturers like Uniden quickly stopped production of all the 'crystal matrix' stuff except for demand orders and started 'redesign' for expanded channels. The TRC-152 was the 23 channel 'version' of the TRC-52 prior to the TRC-452. The TRC-152 and the TRC-452 were essentially the same radios. BUT I did not say exact. The official 40 channel radios were much 'filtered' on the jacks so the radio didn't 'leak' on receive, something the 40-channel radios had to meet a much tighter spec than the 23-channel radios.

But there was one other important difference. And that's why I mentioned this whole thing. The VCO. The TRC-152 had I think a UHIC-003 or something as the VCO. The TRC-452 used something like a UHIC-004 or whatever. I don't recall the numbers but it's the oscillator that the PLL (the uPD-858) controlls to actually give you the 'channel'. The early VCO chips wouldn't go that wide. Although the uPD-858 would go '400' channels, (OK, actually 399) it would not actually operate this wide. There are practical limits to what you can do. But the bottom line is it's the VCO that is the limiting factor in almost every one of the radios that use this circuit. I don't know what the 'full compatibilty' is of the chassis for other VCO chips, but changing the VCO is how you can increase range. But then, the peripheral circuitry had better be up to snuff too! As a 'practical' limit, stretching even the TRC-452 out beyond 60-80 channels became unstable.

By the way, Radio Shack used to stock all kinds of parts for the repair of the TRC-452. Like the selector switch, dial, and dial clamp. Just a quick 'drop in' to convert 23-channel to 40-channel (not legal of course, but those parts were constantly on backorder at RS! Gee, how did I know that???) It wasn't worth changing the power cord or the front faceplate though.

Another note... If I remember correctly, the TRC-52 was $140. Same as the TRC-452. But when 40-channel was announce, the 23 channel stuff was all on sale, and I don't think a single TRC-152 was sold for more than $100!!

And finally, the uPD-858, in ANY implementation, used a straight
BCD decode for channel. If you don't understand that, then you
need DETAILED instructions. If you do, then ANY mod for 'channels'
is trivial.

Please replace your existing chip with a socket...and
then a new chip. BTW, used chips are available from Derrell.
http://www.chipswitch.com/Service.htm
How to install the 'cut' 64 pin socket is found at
http://www.chipswitch.com/Socket.htm Buy them anywhere.
Also, replace the capacitor on the backside of the pcb.
Very last of all, after thorough cleaning of the pcb and
the socket, install the CHIP.

(Large Grin) I agree that the economy is directly affiliated with the world bank and to a certain degree, Greenspan controls it here, not the President. I will not be led toward a caucus-type debate. That was never my intent. As far as my party affiliation, I am registered Independent and have voted in every election since I was old enough to vote. The last 4 or 5 presidential elections I wasn't voting for someone, I was actually casting a vote to keep another party out, which does not necessarily mean I endorsed the candidate I pulled the lever for. And indeed I was a hard-core Republican in my younger years, at least until the party became overwhelmingly saturated with fascist commies not unlike yourself alluding to comments concerning "rounding people up". The Fondas have no respect here. My father was MIA in 'Nam so don't try to psychologically dissect my post and draw inferences pertaining to my views by what you THINK you may learn by what I posted. All parties currently involved in the political arena are corrupt. We agree there. The difference between us is quite obvious. I can see your point of view without personally attacking you, no matter how trivial I may feel your argument. On the other hand, by your post, it is obvious that when someone disagrees with you (at least on political views), you immediately went on the defense. No one was attacking you. It has always been my experience that when someone leaps that fast to attack another, that individual begs of their own resolve..

Copper no longer sells the Chipswitch IC. Bill's CB,
Derrell, and others listed on
http://www.chipswitch.com/Sales-Install.htm
do. Bills CB throws the socket in free with the
purchase of a Chipswitch. Derrell also makes the 12 Meter
modifications.

638. Emperor TS 5010 swinger mod or similar needed

Newsgroup: rec.radio.cb
Date: 2000-02-07 00:00:00 UTC
From: Ken & Melony Graham <jumpy@bluegrass.net>
Message-ID: <949942094.876721@news.bluegrass.net>
Source record: 23236

My buddies TS 5010 does not have a good dead key to modulation ratio but when the dead key is set to 25 watts the damn thing does almost 50 watts. Im trying to open it up a little. Currently when the dead key is at 2 watts the radio will do 6-7 watts. When the dead key is at 4 watts it will do 12-13 watts. I need more swing to say the least. Thanks for any help all.

Ken

Source record: 23237

Well Hutch I think you have chosen a good radio and the mods for these radios are fairly simple. I do recommend that the modulation be opened up and this is a very easy and minor modification that will not hurt your radio in anyway. The more extreme modifications will allow your radio to achieve much higher output anywhere from 20-30 watts but you run the chance of something burning up if not done correctly. As far as the warranty goes most Tec's will give you a warranty if they put their particular mod in the radio and normally this is a pretty good deal. Good luck man

Ken

On the PLL Data Book
I went through it cover to cover about a year ago (maybe the old version) and it was useless.
Unless you understand the tech. side of electrons very well.

I have been in CB for 25 years and worked at a CB repair shop for 3 years back in the 80s and do a lot of my own work and it was hard for me to under stand.

It was mostly theory and how the chip works.
The new version may be better but I wouldn't spend the money unless I Knew someone with the book I could look through first.

Hi Tim, long time no hear. Surprised you didn't tell them to beware of step 4.

Somtimes you can't cut the trace to disconnect the pads from ground. Yuo
actually have to unsolder and lift the leads of the chip. When I have done this
I slide a small piece of Teflon underneath the leads to keep them from shorting
out. Also the leads are very stiff and don't like to bend. They will break

fairly easily.To solder on the resistor I bend the lead into an L so that bridges both leads together.

Oh yeah, In case I forgot to tell you on the LSB mod you can correct the readout offset problem by lifting the USB pin and connecting it to a switch. I forget how it has to be. Ithink it is grounded for USB and 5 volts through a 10 k resistor for LSB. I don't have my radio anymore so I don't remember what pin it is either.

Hey Kingpop! I don't Know why you would even bother to reply to that kid. Little twits like that living at home with mommy and daddy have no concept of what it takes operate a business. They just are so unhappy with their own pathetic existence that seek to make themselves feel better by making others feel the miserable too.

I've seen your ads here and your listings on ebay and I've been to your web site and it looks to me like you offer some excellent values. Who cares what copper is selling things for? Anyone one who has ever had to deal with them in customer service issue (not to mention the allegations that surface on this group from time to time that they sell factory repaks as new) knows you get what you pay for. Their just a bunch of predators trying to use their size to put all the small guys out of business. Then what do you suppose will happen to their low ball prices?

You can't let these little kiddies that surf around on their parents computer stirring up trouble bother you. Although If he keeps slandering you and your business (saying you are ripping people off) in public like this I'd call a lawyer in Panama city, FL. where he posting from

(NNTP-Posting-Host:1cust102.tnt3.panama-city.fl.da.uu.net 63.15.220.102)

through msn and have him get a court order to make his IPS revel who he is (if necessary, a good lawyer could probably use a little social engineering to get the the info.) Then haul Him and his Mommy and Daddy into court.

Hi all
Does any one know where I can buy an I-max 2000 antenna?Myself and two other freinds have ordered three of these antennas from coppers over a month ago and have still not recieved them.They say they do not have any in stock and don't know when or if they will get any in.I would like to try one.Who has them in stock?I cannot see paying a real big price for one either.How about the ABS 1600?Is it comparable to the I-max?Coppers says that they can ship the 1600 right away.

Thanks all who reply.

> got poorer.

you list a lot of facts as you call them , but who knows what your
basis for these so-called 'facts' is. i submit to you that you never
were a conservative, my friend, and you never will be either. that is
to bad, however we do not need you anyway. and i am not going to defend
any politician. they speak one thing and do another. it has come down
to a matter of degree. at the present time i myself reside in the
republican party not because i want to , because i have to and it is by
default. nobody else comes even close representing my views and that is
a shame. maybe we need term limits. now if i could . i , myself ,
would rectify all the situations you say, but i cannot, get a audience.
why , because i have no money and no power. anyone could do better as
president of this country than a lot of the people that have been
elected. the problem is that a lot of the wrong people are being
elected. i think it is imperative that all people vote. but you get
more of a rise out of people about sports bs , than you do about what
is really important. why is it that the number 1 tv program in this
country is the wwf or that stupid million dollar show with regis
fillman. boy does this speak volumes. it means that most people are
either too lazy to think or too stupid. and that is dangerous.
citizenship is a necessity, a choice and above all else a priviledge
and if we choose not to be involved, then we loose. i cannot
overemphasize the importance of this next election , possibly the most
important one in this nation's history. the battleground is set. do you
want people in there that are pro death (to unborn children , which are
potential american citizens), pro homosexual, pro labor, pro socialism,
pro gun control, pro big government ,etc, etc, or do you want to try
and stem this tide. i for one think the battle is lost already. but i
am willing to hope and that is all i can do. and i will battle with you

my friend. i think you are a democratic party hack , who gets on here
and says one thing and does another. you talk about the inconsistencies
in that grand old party of which i am presently affiliated mostly
because you are now and always have been a liberal democrat. you
liberals always preface what you say by saying that you used to be this
or that. straight out of the liberal democratic party talking points
mantra. so tell me some more lies twisted because your arguments are
twisted and that is the truth . oh by the way , how does president dan
sound good buddy? if i was the pres , i would bring honor and dignity
to the white house again(after of course fumigating the place to get
rid of the aids viruses present from all those homo boys having sex in
the bathrooms of the place, how dispicable) and one of the first of my
official acts would be to have your ass picked up by the truth
commission and get your attitude adjusted. so your arguments don't
fly , twisted , and your radio sucks too, i bet, so take a big number
and stand by , while a real man talks on his computer,.....cd is
out.....

Why take an extra when all your connections are available using the general class. CB operators make friends on their frequencies and those with General Class certification really do not have to or do not want any higher rating because what they have meets their needs. Very simple. Its like a BS degree, if this meets your needs why get a Masters. IF a masters meets your needs they upgrade to a Ph.D The pay is not greater! It all depends on the needs of the person or individual.

Sounds like fun. I will fire up the rig and take a listen. You know that 14313 and especially 3898 are my current favorites. Can you promise more fun than that? I just bought a really big linear and big beams for my debut into the hellhole called HF. I'll bring the hotdogs and other eats, and you bring the beer. We'll party like hell and raise a little too for old times sake. We can fry the hot dogs on the top of the 15kw final stage I used to use for CB. I even have 90KW Kohler generator to keep us on air, if someone kills the power cause they're ticked off we blew wrestling off their TV.

Let's do it.

> coming off of seven and one half years of having to put up
>with the most corrupt administration in american history,

i agree along with the lowest inflation rate, the lowest unemployment and the highest stock market in U.S. history.
these are things that the reagan administration only dreamed of. for him, they were obviously pipe dreams and i think his altzheimers had set in at the begining of his administration.
i am not equating reagan to hitler but there was one similarity, hitler, at the end of his administration, was moving troops that didn't exist.
during all of reagans time, he was moving money that even our grand children didn't have.
the pranks that clinton has pulled were, with out a doubt, wrong but his dealings with lewinsky did no colateral damage to our country like reagans financial policys did.
if you were having an affair with someone on your job, it wouldn't be right but, at the same time, it wouldn't be anyones business but you're, hers and your wifes business.
the biggest damage to this country done anyone was done by the republican vultures.
if clinton were impeached, who would we get but al gore.
if clinton were able to be re-elected this year, it would have made great political sense to get him out or at least smear him.
being that he has reached his limit, all it did was to make the republicans look like idiots.
i voted for reagan because i was sucked in by the promise of tax cuts. if i would have known that he was going to produce the biggest deficit in history, i would have campained for anyone else.
most of the satire here has some basis in fact.
as far as your poll tax, the constitution guarantees the right to vote.
would you be in favor of repeaing the constitution also?
jeff

No matter what this guy said to you I think you just demonstrated the poorest behavior a person in business can possibly come up with..

The best way to deal with emails like that is to ignore them and block the sender.
Calling him names like "penny pinching dick heads" does not spread good talk about you. I too will buy from the lowest price and if you cant offer the lowest price get out of the business because there are 100 guys waiting to take your place.. Welcome to the sales business.

I got a 122XL for Christmas/ The noise blanker works great and I got plenty of punch out of the radiobut, I was unable to ever get a good sound out of the radio. I tried many different mics including an Astatic Noise canceller, A D-104 m6b, the stock mic, and a couple of different cobra mics as well as a radio shack preamp mic. None of the mics produced a good sound and everyone complained about it. I ended up going back to a Cobra 25 radio. I guess that will teach me not to try and buy cheap but rather get what I really want.

: DOES ANYONE KNOW WHAT IS THE REAL DIFFERENCE BETWEEN THE SMALL
: SATELLITE DISH AND THE MUCH LARGER DISHES?

The FCC has ruled that homeowner associations cannot prohibit the small dishes. They have also ruled (if I recall correctly) that Ham antennas cannot be prohibited - although they can be restricted to a size that "does not interfere with desired communications".

If my memory is right about the latter, then get your Ham license. There is no way that the association would be able to tell the difference between a CB antenna and a Ham antenna.

: scope and a bird meter (I think thats what he said) he told me that I
: really wouldn't see much of a difference if he pulled Q33 out of it. He
: also did a frequency alignment for 10 meters. Why is that SSB peak
: reading so hard to believe? The radio has a 2166 driver, dual 1969
: finals, and a very heavy duty finned heat sink back panel. If it makes
: you feel better the peak readings were 10 watts AM, and 17 watts SSB
: with the cheap stock mic when the radio was new out of the box. The
: higher readings the tech got were with an Astatic 575 while yelling
: AAAUUDDIO, HHEEELLO.

Even a Bird meter can be fooled by a square wave - which is most likely
what you were getting from the overmodulated signal. See the Bird web
page for information.

The proper way would be to look at the output voltage on an oscilloscope.
If you have the voltage, you can calculate the power by using the formula
P = (E^2)/52 (assuming 52 ohm load). If you want a more accurate reading,
you will measure the collector current. Then P = EI.

Larger. A full wave would be about 1/3rd meter - figure 1 foot when
allowing for propogation factor in the antenna. So a 5/8 wavelength
antenna would be around 7-8 inches long.

SWR can cause the power meter to read higher or lower than the actual value.
Usually if the SWR is limited to a value that is normally safe to operarte with
it is not a problem though.

Source record: 23305

Most of the PLL Data Books that I've seen are NOT for the novice.
In fact, not even for most techs. Don't feel bad when you're trying
to understand the thing. What is actually implemented in a CB set
is usually just a subset of what you'd find in the PLL Data Books.
But then, the data books aren't geared with showing you how the
thing works, they are geared towards showing you what it could
do. Further, showing you what the parts could do if designed in
different ways. Whereas you are looking for what the part could
do in your 'specific' design.

I think Don Lancaster had one of the PLL CookBooks that was
pretty good at one time. Not only gave theory, but also gave
some practical applications of that theory. Made PLLs easy
to understand. Once you get that, then figuring out stuff like the
858 is cake. But I'll warn you now, I have yet to see ANYTHING
that makes it easy to understand the Motorola chip that's used
in the Ramsey 2M kits that's coupled with that dual-modulus
prescaler! Read, read, read, and then reread...

Actually it is considerable. It is the amount of band space from
advanced to extra (175KHz total) which is negligible.

General to advanced almost doubles the HF space on the non WARC HF bands
15-80

Here in the UK CB passed away ten years ago and it wasnâ€™t even given a decent burial. However, my wife thinks itâ€™s the best thing that ever happened since the introduction of the free contraceptive pill in this country. She would have rather stuck pins in her eyes than sat at the CB to have a ratchet with someone.
Sadly the CB boom had the same lifespan in this county as the yoyo, not to long. This was not because people where fed up with the hobby it was due to a combination of many things. Firstly theyâ€™re where the disc jockeys, the dead keyers, and 40,000 people trying to modulate on 40 channels FM!!! There where other stupid restrictions like the antenna was not to exceed one metre in length (thatâ€™s 39 inches) and not allowed to exceed 1 db gain (we have even had to change our freaken measurements since we joined Europe).
Then there was the cost of the equipment, which is twice as much as you pay in the States (I saw a solercon 99 on the web yesterday for under $38 dollars. Twelve years ago I would have had to sell the wife and kids into slavery (and I wish I freaken well had) to pay for one. And as for a Cobra well just mortgage the house.
You boys and girls across the big pond donâ€™t know how lucky you are. Massive country dirt-cheap cost of living and gas at about $1.50 per gallon compared to the $6 yes thatâ€™s right $6 per gallon that we have to pay under this communist government we elected 3 years ago
Well finally the morons that regulate the hobby decided to do something about it 10 freakin years after it died. They realised that there was less than 20000 people who posses licences (cost about $25 every year) only the British would stand for it.

That is what I am saying. It is like putting headers on a motor. The who do you give the credit to the guy that made the headers of the guy that built the motor?

Greetings!

I would concur with tmon...

perhaps resetting the html for something more natural...

This is your original...

Messing around...I come up with a better resolution by reducing the
width and letting the height stand as 40

Like this...

Makes a much better looking "border"...

On Mon, 07 Feb 2000 15:34:50 -0500, while the modem was pondering it's
navel, tnom@mucks.net dissertated the following:

Greetings!

klunbk

Well, I'm not going to persue this any further...

People that run into problems like this due to CCRs' like the ones
described here have my sympathy...

It's a little too close to infringements...

Can't cite creed, religion, handicap or race...

So they come up with Covenants and Restrictions.

Welcome to segregation...

Go ahead and flame away...I'm done...

I'll ship you some gas for $3.00 per gallon..
I'll sent you an antron for your wife (keep the kids).
I don't need a house in the UK so I guess you aren't getting a cobra from me!!

--
www.bayshorenetwork.com

"mickey" <mickeyNOmiSPAM@mickeys.co.uk.invalid> wrote in message news:20ce809a.18bfb437@usw-ex0105-040.remarq.com...
| Here in the UK CB passed away ten years ago and it wasnâ,,"t even
| given a decent burial. However, my wife thinks itâ,,"s the best
| thing that ever happened since the introduction of the free
| contraceptive pill in this country. She would have rather stuck
| pins in her eyes than sat at the CB to have a ratchet with
| someone.
| Sadly the CB boom had the same lifespan in this county as the
| yoyo, not to long. This was not because people where fed up with
| the hobby it was due to a combination of many things. Firstly
| theyâ,,"re where the disc jockeys, the dead keyers, and 40,000
| people trying to modulate on 40 channels FM!!! There where
| other stupid restrictions like the antenna was not to exceed one
| metre in length (thatâ,,"s 39 inches) and not allowed to exceed 1
| db gain (we have even had to change our freaken measurements
| since we joined Europe).
| Then there was the cost of the equipment, which is twice as much
| as you pay in the States (I saw a solercon 99 on the web
| yesterday for under $38 dollars. Twelve years ago I would have
| had to sell the wife and kids into slavery (and I wish I freaken
| well had) to pay for one. And as for a Cobra well just mortgage
| the house.
| You boys and girls across the big pond donâ,,"t know how lucky you
| are. Massive country dirt-cheap cost of living and gas at about
| $1.50 per gallon compared to the $6 yes thatâ,,"s right $6 per
| gallon that we have to pay under this communist government we
| elected 3 years ago
| Well finally the morons that regulate the hobby decided to do
| something about it 10 freakin years after it died. They realised
| that there was less than 20000 people who posses licences (cost
| about $25 every year) only the British would stand for it.

A true tech won't do this illegal mod,the PC66 is a good radio so
leave it alone.If you need more range go with an SSB rig like the Grant.

Same radio as the Eagle Spitfire 454 10 Meter handheld. Much better radio with many more features than the Cherokee. These radios once converted, have 454 channels and are all mode...AM, FM, USB & LSB, they can also do split frequency for access to 10 meter repeaters. They can be modded for 11 meters.

I never said he did not know his theory, But we are talking about loss on a piece of equipment that is in a cheap plastic case. He was talking about mounting the connector in the case of this cheap cordless telephone. Why did'nt he go ahead and inclose the whole damn phone in an aluminum case and drive a couple of ground rods while he was at it. I do agree he knows his theory, but he was trying a little to hard to prove this point.

Personally I think you would just be an idiot to not take advantage of the modulation mods at least.... The modulatiuon will make up for the fact that ot does not have a power mod, but since the tech is already inside the radio you might as well have him do the swing kit too.

To stir the pot, but I have tested the Two Watts.I will have to admit though that I owe you an apology on the post about this antenna, I seen the antennas after the post on another site with better pictures and they looked like a decent antenna. I just oppose the use of too many dissimilar metals in an antenna, even if you use some sort of anti oxidation type grease. They seem to have problems when exposed to big watts daily for a couple of years, but as I said I owe you an apology as these antennas look well built.

I'm not sure if a Mo-watts is a copy of a Dave-Made; but I believe it comes down to one simple fact. The technician making that extra effort to make sure the box is right (vice good enough.) all the way from the mud puppies to the big kahunas. Get's my money every time.

718. Best C.B. dealer on the Net

Newsgroup: rec.radio.cb
Date: 2000-02-07 00:00:00 UTC
From: Michael1998@webtv.net
Message-ID: <11631-389F8F8A-73@storefull-133.iap.bryant.webtv.net>
Source record: 23337

Can anyone suggest a good place to buy a C.B. from on the internet, both in terms of price and reputation. I have been looking at maybe buying one of the new Cobra SoundTracker radios, and was wondering of a good reputable dealer that sells online. I have bought from Scanner World in the past and always been happy, but I'm not sure they carry the radio I'm looking for. I am kind of hesitant in buying from a dealer that sells export radios and 10 Meter radios as well as C.B.s, simply because I never know for sure if the radio is truly "factory sealed" or if I can deal with the dealer if I should have a problem with the radio, just my opinion. I have bought from Copper Electronics in the past, but I'm not sure I want to deal with them again because I have actually been to the store, plus they tend to promote modifying C.B.s to operate in illegal manners, such as getting on 10 Meters when you don't have a license and talking to ham operators. I don't think that's what C.B. should be about, not to mention the fact that it's illegal. I'm not going to lie and say I've never worked skip on a C.B. or talked out of band or on a radio that was pushing a little more than 4 watts, but I wouldn't recommend that anyone do this. Just my own opinion though. Any way, I still enjoy C.B. from time-to-time as I grew up with it and was looking for a good, reputable dealer online. I am planning on changing jobs sometime in the spring and was looking for a good radio with weather band that I can throw in the car when I commute to and from work. They say the weather may get rough here in central Kentucky this summer, that's why I want a C.B. with weather band. Can anyone help me out? Please e-mail me and let me know. Thanks a bunch!

A true tech won't do this illegal mod,the PC66 is a good radio so
> leave it alone.If you need more range go with an SSB rig like the
Grant.

Now how do you suppose Hutch is gonna' talk with anyone on ch 19
if he's on SSB?
And for that part about the illegal "mod", get the modulation
turned up to where it's doing 100% and don't worry about the power
output unless it's below about 4 or 5 watts dead key. Put your
emphasis on the antenna system.
I'm just dying to know what a "true tech" is.

Bend a little L in the pullup resistor, tin the resistor and bridge the two lifted legs with the bottom of the L and solder in place. The leads are stiff and will break off if you bend them too much. Also slide something under neath the leads to keep them from shorting back to the trace. I 've used little pieces of Teflon for this and put it in place before I solder.

725. RCI 2970 MOD

If anyone out there knows how to improve output swing with a mod that affects the AF circuits please email me. I have seen the RCI Bible and I have already tried the mod in that document but the swing is limited to 6W dead key to 14W with modulation. The amp I am driving could use a larger swing. Thanks in advance for you help.

John

Date: 2000-02-08 00:00:00 UTC
From: poofbutt@eudoramail.com
Message-ID: <38a077dd.880582@news.gte.net>
Source record: 23346

Hi Guys!

Had this one on the shelf a while., Tested and it works pretty good!

Anyone have the peex and tweex for it? It appears to NOT have a PLL
and only has 2 or 3 crystals!

Also been wodnering if any extra channels can be added?

This is an AM only unit, with 40 channels and works fine with a 5 pin
radio shack mic.

What's sorta cool about it it that it really doesn't seem to have alot
of stuff on the circuit board. Alot looks like it is 'missing', altho
the radio works fine. i am guessing this could be the same board used
for an equiv side band unit?

Anyway, I like to setup friends and relatives with cheap cb's for
emergencies (ie: cig lighter connector, mag mount and cb in the trunk
and they are set!) at least, and some have gotten into them as a lite
hobby.

thanx - poofy

Per the ARRL you can take the written part of the test now and after April 15
present proof of current license, passing the General written portion to
upgrade. If you are a Tech Plus your current license may only say Tech in which
case you will need proof of passing the 5WPM code exam. The FCC did not
maintain a database of the Tech Pluse Liscense.

The SA-4 is a whip antenna about 30" long. I've tried telescoping antennas on handhelds before and always managed, based largely on my clumsy nature, to break them! I have not done any specific range tests on them. Where my signal was breaking up before, the SA-4s come in quite clear and stayed clear farther out.
I don't have any info on the WTA-1 for you. Hope this helps out some.

"Jeff Herrings" <jeffherrings@mindspring.com> wrote in message
news:87lofr$jk2$1@nntp2.atl.mindspring.net...
| Well then. Think of this newsgroup as the CB band. What do you do on the
| CB? More than likely, assuming you have a life, you talk about anything
and
| everything that comes to mind. I believe I am correct when I say all of
| this. So, if you wish to be STRICTLY on "band" perhaps those on the ham
| radio newsgroups would be interested.
|
| I myself thought the post was humorous. Then this is assuming you have a
| sense of humor. Oh well, your post itself has nothing to do with CB
radio,
| just bitching. Dont they have a "band"/newsgroup for that sort of thing?
|
| Yeah, I said it...
|
| Gene Tucker Ph.D wrote in message ...
| |This material really belongs with those kids that cannot think of
anything
| |else to do. Nothing to do with radio or the web site. Just a waste of
| |everyone;s time and your creativity if you ever had any.

< SOOOOOOO!!..... and how long did it take you to come up with this
startling discovery pal?>

I will not be led toward a caucus-type debate.

< oh so you come on a cb ng and think you are going to say what you
want without getting some static, well not going to happen, not as long
as curious is out here and that is a fact jack. you know i have to
listen to the liberal democratic media all the time but i am not going
to listen to it here.>
That was never
> my intent.<
< your intent is suspect. i still say you are a liberal democrat,
spewing your mantra on this ng. i don't think it takes a whole lot of
intelligence to vote independent under the circumstances we now face.

As far as my party affiliation, I am registered Independent
> and have voted in every election since I was old enough to vote.<

<what happened, did you smoke too much dope?>

The
> last 4 or 5 presidential elections I wasn't voting for someone, I was
> actually casting a vote to keep another party out, which does not
> necessarily mean I endorsed the candidate I pulled the lever for.

<please explain the above statement>

And
> indeed I was a hard-core Republican in my younger years, at least
until

< i have never been a hard core anything, your habit of changing
affiliations is most interesting. conservatives are conservative, no
matter what the party . it all boils down to mindset.

> the party became overwhelmingly saturated with fascist commies

<fascist and communist are two diametrically opposed ends of the
political spectrum. i don't see too many fascist these days except
maybe in europe.>

not
> unlike yourself alluding to comments concerning "rounding people up".

< that was a joke you idiot>

> The Fondas have no respect here. My father was MIA in 'Nam so don't
try

< oh hold up , now. even hanoi jane has a right to change and you know
what she has. and she got that knucklehead ted out of her life to.>

> to psychologically dissect my post and draw inferences pertaining to
my
> views by what you THINK you may learn by what I posted.

< aw , i don't think you would be hard to figure out, it would be a
cakewalk, don't flatter yourself .>

< All parties
> currently involved in the political arena are corrupt. We agree there.
> The difference between us is quite obvious. I can see your point of
view
> without personally attacking you, no matter how trivial I may feel
your
> argument.

< my argument is anything but trivial, and that is a cute little reply
but lacks merit>

On the other hand, by your post, it is obvious that when
> someone disagrees with you (at least on political views), you
> immediately went on the defense.

<no if you think i am on defense, then you haven't done much arguing
have you , so talk to the hand>
No one was attacking you. It has always
> been my experience that when someone leaps that fast to attack
another,
> that individual begs of their own resolve..
>
>

< that statement makes no sense whatsoever, 'begs their own resolve',
what i am begging is for you to explain what planet you have been
living on for the last several years.>

i still say your radio sucks and your arguments are a waste of my time.
if you wish to debate political matters , then come at me with
something that has some relevance. and while you are at it instead of
trading barbs why don't you just tell old uncle dan what it is that you
want in this country, and what it is that you expect from this country.
let's just cut to the chase, i want to see where it is that you are
coming from, instead of sitting here listening to this unnecessary
diatribe about issues of unimportance at this level,.....cd out........

I most humbly accept your apology Sir! In addition I would concur with your observation about the problems that metals of different potentials can cause. I have, although, always had good results using Noalox Anti-Oxidant compound made by ideal Industries. It consists of fine zinc
particles suspended in a carrier material. The zinc particles penetrate and "cut" the aluminum oxide, providing additional current paths for improved conductivity and cooler connections. It is a good idea to use this even with aluminum to aluminum interfaces. The nature of aluminum is such that it oxidizes almost immediately after it is created. You can't always see it but it's there. Aluminum oxide is a extremely poor conductor, not only can it build up between joints causing discontinuity in them, but can also impede the movement of the wave front along the surface of a continuous piece (skin effect and all that).

For peak efficiency when assembling a aluminum antenna one should always burnish the joint contact surfaces until they are nice and shinny with one of those green abrasive "scotch pads" (DON'T USE STEEL WOOL) one joint at a time. Immediately after coat the surfaces with the Noalox. assemble that joint, and then go on the next. After the antenna is assembled wipe the whole antenna down with solvent to remove any of the Noalox that may have gotten smeared, and then scotch pad the antenna about 3' at a time once you have 3' nice and shinny wipe with solvent again and coat that section with a high quality Zinc Chromate primer. After the whole antenna is cleaned and primed go over the whole thing again and give it a another coat of primer. (be sure you don't paint any of the insulators with the Zinc Chromate, they wont be insulator anymore if you do) Then finish it off with a couple of coats of a good quality spray lacquer like Krylon (your choice of color). A antenna so laboriously prepared will give many years of trouble free, top notch performance. Taking down old antennas that have been up for a few years and doing this to them almost always makes a big difference in their performance, especially on the receive.

I know, I know, your saying to yourself, geeeez!!! Does this guy ever do anything the simple way? No, I don't, and I have driven myself and people who have had to work with, and for me nuts sometimes with my perfectionism. I can't help it it's a inborn trait. ;~)

Chow for Now

750. Brand New DeltaForce Magnums on Ebay $259.00 (DUTCH)

Newsgroup: rec.radio.cb
Date: 2000-02-08 00:00:00 UTC
From: Antenna Warehouse <kingpopXXX@cis.net>
Message-ID: <389FD0EE.59EB2AC@cis.net>
Source record: 23369

I have 15 of the DeltaForce Magnum SSB/AM/FM/CW Transceivers up on a Dutch auction on Ebay at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=255222923

These radios are designed and production supervised By RF Limited, and are packed with features that no other radio on the market has. Like RF Limited's Turbo Echo, and no squeal all mode talkback. They will also cover from 25.165-29.699 in 10 bands once the MARS/CAP Modification is performed

This is a Dutch auction, which means no worries about being outbid at the last moment, or the price sky rocketing because of bidding wars. Your bid of $259.00 plus shipping gets one to you. Shipping will be based on exact cost to your location via USPS insured priority mail from zip 52730. If you want to know exactly how much shipping is, go to:

http://postcalc.usps.gov/

and use the rate calculator to find out. The shipping weight is 6 pounds.

Thank you

Tim

Well. You "know" what it is. But you dont know how to operate it. Ummm.
I couldn't tell you either, sorry. I suppose that is why I never bought a
linear amplifier. That and the fact that they are illegal. I would rather
just talk on my 4 watt untouched CB radio so that no one will hear me during
the day because of all the SUN SPOT ACTIVITY!

Yeah, I said it....

Err. "Lil-Wil" is an antenna by Wilson. You probably meant the "Lil Pre-Amp" Though, to be honest, I would not get this, since I have had a couple radio's come to me where people put it in themselves, and some of them claimed they had a "tech" put it in. These little things will in some cases just eat your output straight up. I build my own for about $2.00 a board... Im not quite sure of how much these things go for, though I am guessing around $20.00 or more.

Yeah, I said it...

Tam Green wrote in message <87de76$3vm$1@news.ipa.net>...

I'm interested in why you don't wish to run an external rectifier?

Under the hood space limitations!?

I would of thought one benefit would be better cooling for both the
alternator and the rectifier stack?

Just thinking aloud.

Well I've only booked an 'economy' car out of Cincinnati in May.

If I put that 500lb PSU in the trunk It'd turn my wheels into one of those looowriders but without the hydraulics:-)
>hehe
I'm contacting BESCO's (used broadcasting equipment dealers, down your way I believe) freight company (I think they're called Owens International) to get a quote for shipping the CCI 5Kw AM tx I've found in Kentucky. It seems they do things properly and remember to pack the tubes separately!

The air freight will cost more than the tx which I can have for around 1000 USD.

759. Re: Extending The Range of Cordless Phone

Newsgroup: rec.radio.cb
Date: 2000-02-08 00:00:00 UTC
From: phil <phil@invest.fsbusiness.co.uk>
Message-ID: <2LgzANAuZ+n4Ewnu@invest.fsbusiness.co.uk>
Source record: 23378

Jeff,
>Thanks to all that helped with this. I should have known I'd get a lot of good
>feedback from this group. Thanks again.
I've come into this thread rather late but I hope you'll let me impart
my experiences in this area.

We have not dissimilar cordless phone spec's here in the UK.

I sold un-approved (read that as illegal) 'Long Range' cordless phones
for nearly ten years up until around a year ago.

I was busted twice for offering to supply this equipment, court, fine,
the whole works. It is a criminal, not civil offence now here in this
country so it's on one's record.

We have four cordless bands, 1.6/49Mhz, 47/77Mhz(the best performance
system specs but none have ever been on the market), 900Mhz Spread
Spectrum and quite recently 46/49Mhz, very similar to the US as far as
channels go.

The latter two bands 'approved' equipment are IMO limited in there
ability to be upgraded, this is due to very low power out. The 46/49Mhz
bands are too close together to run separate antennas on the base
without causing de-sensing of the receiver.

I have tried high quality 9db gain marine cellular antennas on the
900Mhz KXT Panasonics, still a poor performer.

There are some wonderful equipment made in Taiwan for 900Mhz. I have a
cellphone lookalike with 25w at the base, 6w at the handset both with
TNC connectors, base and car roof co-linear antennas, but you'll pay!
Don't ask.

And they are illegal both here and in the US

The best band for performance/price just has to be the low band VHF.
45-49Mhz base tx, 67-72Mhz handset tx. I know your LMR equipment can
reach the sky and back, especially under lift conditions. I've heard NY
police in England!

The Jap made Superfone CT505 (48/68Mhz) is probably the best known.
Retails at around 500 USD. 10 channels, 1.2w base, 700mw handset.

The base has a pair of SO239 sockets for separate 1/2 wave dipoles, the
handset comes with a full 1/4 wave telescopic (which always breaks) that
can easily be changed to a BNC for use with a seperate car roof mounted
antenna.

With both base and car roof antennas you can get a reliable 12 miles from this old fashioned looking system.

With 25w amp's at each end you can triple the mileage if you do a good installation and optimise all antennas.

A friend's Audi Quattro was up on ramps inside a garage when the phone rang. He climbed up the ramps to answer the phone but could not connect with the base. The 25w just could not reach the base.
To check that this was not some spurious signal accessing his mobile he called home on his cellular. Sure enough the car rang again.

His best to date, 57 miles. Though it was one way only and he had a 100w LMR base amp at the house!

Thank you Tnom, for first alerting me to the problem on the page.
Please excuse my original flipped reply. I had no idea what you were
talking about at first, and thought you were pulling my chain. I have
made the change Andy suggested and it should work for you now.

Sincerely

Tim

This one is courtesy of Silly813@aol.com
ENJOY!!!!

Beer vs. pussy:

A beer is always wet. A pussy needs encouragement.
Advantage: Beer.

A beer tastes horrible served hot. A pussy tastes better served hot.
Advantage: Pussy.

Having an ice cold beer makes you satisfied. Having an ice cold pussy makes you Hillary Clinton. Advantage: Beer.

Beers have commercials making fun of skunky ones. Pussy does not.
Advantage: Tie.

If you get a hair in your teeth consuming pussy, you are not disgusted.
Advantage: Pussy

24 beers come in a box. A pussy is a box you can come in.
Advantage: Pussy.

Too much head makes you mad at the person giving you a beer.
Advantage: Pussy.

If a beer is brewed with yeast, it is still edible.
Advantage: Beer.

If you come home smelling like beer, your wife may get mad. If you come home smelling like pussy, she will definitely get mad.
Advantage: Beer.

6 beers in a night and you better not drive. 6 pussies in a night and you have done all the driving you need.
Advantage: Pussy

Buy too much beer and you will get fat. Buy too much pussy and you will get poor.
Advantage: Tie

It is socially acceptable to have a beer in the stands at a football game. You are a legend if you have a pussy in the stands at a football game.
Advantage: Pussy

If a cop smells beer on your breath, you are going to get a breathalyzer.
If a cop smells pussy on your breath, you are going to get a high five.

Advantage: Pussy

With beer, bigger is better.
Advantage: beer.

Wearing a condom does not make a beer any less enjoyable.
Advantage: beer.

Pussy can make you see God. Beer can make you see the porcelain god.
Advantage: Pussy

If you think all day about the next pussy you will have, you are normal.
If you think all day about your next beer, you are an alcoholic.
Advantage: Pussy

Peeling labels off of beers is fun. Peeling panties off of pussy is
more fun.
Advantage: Pussy.

If you try to snag a beer at work, you get fired. If you try to snag a
pussy at work, you get hit with sexual harassment.
Advantage: Tie.

If you suddenly drop a beer, it may break. If you suddenly drop a
pussy, it may hunt you down like the dog you are.
Advantage: Beer.

If you change to another beer, your old brand will gladly have you back.
Advantage: beer.

The best pussy you have ever had is not gone once you have enjoyed it.
Advantage: Pussy.

The worst pussy you have ever had is not gone once you have enjoyed it.
Advantage: Beer.

Bad beer: Schlitz, PBR, Old Swill. Bad pussy: Roseanne, Janet Reno,
Madeline Albright.
Advantage: Tie

Good beer: Samuel Adams, Moosehead, Pete's Wicked Winter Brew. Good
pussy:
Almost all but the above.
Advantage Pussy.

The government taxes beer.
Advantage: Pussy.

It's a close call, but the numbers never lie.
Advantage: Pussy.

Gotcha

A rather attractive woman goes up to the bar in a quiet rural pub. She gestures alluringly to the barman who comes over immediately. When he arrives, she seductively signals that he should bring his face close to hers. When he does so, she begins to gently caress his beard which is full and bushy.

"Are you the manager?" she asks, softly stroking his face with both hands.

"Actually, no" he replies.

"Can you get him for me - I need to speak to him?" she asks, running her hands up beyond his beard and into his hair.

"I'm afraid I can't" breathes the barman - clearly aroused. "Is there anything I can do?"

"Yes there is. I need you to give him a message" she continues huskily, popping a couple of fingers into his mouth and allowing him to suck them gently. "Tell him that there is no toilet paper in the ladies room."

Cross-posted to: rec.radio.cb,rec.radio.swap,rec.radio.amateur.boatanchors

Looking for 1950s and 1960s vintage Raytheon CB radios
for my personal collection. I have TWR-2, TWR-5, and
TWR-7; looking for others that I don't have. I prefer
sets that are complete, cosmetically good, and either
working or reparable electrically. Also interested in
owner's and service manuals, mics, mouting brackets,
crystals, and other related Raytheon stuff. I may be
interested in "parts units" or "fixer-uppers" also.

Whatcha got?

Thanks and 73,
Dean - K5DH

Look at it from a different perspective. With all of those "roadblocks"
to CBing in your country, those that ARE still there, are likely to be
serious hobbyists, and less likely to be foul mouthed, sociapaths with
ego's larger than their brains. Your interference is also likely to be
serveral orders of magnitude less than it is here.

We may have an "easier" to get to CB, but it also allows the lowest
forms of life to have easy access to ruin the fun for the rest of us.

You guys elected them. That's what happens with liberal thinking people
in power. Tax the achievers to subsidize the underachievers, and drive
the costs of all gooods through the roof in the process.

Move to Cuba, sail to Florida on a raft, claim that your mother drowned,
and the US will bend over backwards to make you a citizen, just to
thrust a political knife in Castro's back.

I find it just a tad disgusting that poor, unskilled, Hispanic people
can come to this country in droves, to take advantage of our welfare
system, and we seem either unwilling or unable to do anything to stem
the flow. While people in "civilized" countries like the UK, have a
difficult, if not often impossible time trying to emigrate to the US.

Hmmmm.. 6w on a battery powered handset must drain the batteries fairly
quickly, unless you drag a large gel-cell along with you. I'd also be a
bit wary about having 6w of RF power at 900 Mhz, within inches
(centimeters) of my head. Cancer fears you know.....

>
> And they are illegal both here and in the US

No doubt.

> from this old fashioned looking system.

That seems a bit optimistic for only 1.2 watts/.7 watts. 5 miles
reliable was what I've been told to expect. Of course your mileage may
vary with differences in surrounding terrian and the gain and height of
the external antennas.

>
> With 25w amp's at each end you can triple the mileage if you do a good
> installation and optimise all antennas.

As transmit power goes up, the likelyhood of receiver desense also goes
up, even with the separation of 20 Mhz. The amp has to be pristinely
clean, with no spurs or other "dirt", plus it would also have to be
continuous duty rated, since a phone is full duplex.

>
> A friend's Audi Quattro was up on ramps inside a garage when the phone

> with the base. The 25w just could not reach the base.
> To check that this was not some spurious signal accessing his mobile he
> called home on his cellular. Sure enough the car rang again.
>

Back when our phones were limited to 1.7/49 Mhz, and little or no
security codes, I used to "play" with a 49 Mhz phone and my 6 meter ham
rig. Running the phone though the rigs power output, and boosting the
output to 10 watts, on a 9 db gain yagi, I could "bring up" the base
units of phones as far away as 5 miles. It wasn't much use, since the
range of the 1.7 Mhz return was less than stellar. But it was fun as a
prank to simultaneously bring up a few dozen phones and call a 1-900
porn line. That must have caused a few eyebrows to raise at the phone
company...

> His best to date, 57 miles. Though it was one way only and he had a 100w
> LMR base amp at the house!

I would guess that at 100 watts, the densense problem was taking him beyond the point of diminishing returns. For every extra mile that his transmitter was gaining, he was killing his receive.

I was aware of CBCI, but I've never gotten anything from them.
I always was the kind to 'figure it out' by myself.

By the way, Scott (I can't recall the last name now) has a web
site that has tons of info on CB sets and mods.

And if you can get ahold of it, the Radio Shack service manual
for the TRC-457 (and 449/458) had an EXCELLENT tutorial
on how the '858' worked. It's different in the TRC-452 of course,
but the BCD codes are trivial to fiure out, once you understand
the chip...

A little help please. I am in the market for a new SSB Mobile radio. I have it narrowed down to 2 choices.

1) Cherokee Nightrider 150

2) Midland 79-290

I have read up on both and I am awaiting the receiver and transmitter specs on the Cherokee from Cherokee Electronics. They both seem to be excellent radios and both had real good write-ups in the February 2000 issue of Popular Communications.

Any help is greatly appreciated.

If you are in a windy area stick to the ham towers. They are
stronger. You may get caught with the tower up in a wind
storm.
Cheers,
John

Agreed!

He may have been a little zealous in his rebuttals, but
he definitely knows what he's talking about.
I personally would not bother with the cordless either.

There are quite a few self-proclaimed RF experts on the NG.
Usually when the discussion get hyper-technical, the not-so
informed folks show their ignorance.

Although I work in the comm. business and have been
around many facets of radio and their inherent problems,
I have never claimed to be the expert. Not everybody knows
everything there is to know about radio (RF).

No offense was intended. I hope none was taken.

Cheers!

The best I have ever found on price and service. Look it over.
"Michael Brown" <Michael1998@webtv.net> wrote in message
news:11631-389F8F8A-73@storefull-133.iap.bryant.webtv.net...
Can anyone suggest a good place to buy a C.B. from on the internet,
both in terms of price and reputation. I have been looking at maybe
buying one of the new Cobra SoundTracker radios, and was wondering of a
good reputable dealer that sells online. I have bought from Scanner
World in the past and always been happy, but I'm not sure they carry the
radio I'm looking for. I am kind of hesitant in buying from a dealer
that sells export radios and 10 Meter radios as well as C.B.s, simply
because I never know for sure if the radio is truly "factory sealed" or
if I can deal with the dealer if I should have a problem with the radio,
just my opinion. I have bought from Copper Electronics in the past, but
I'm not sure I want to deal with them again because I have actually been
to the store, plus they tend to promote modifying C.B.s to operate in
illegal manners, such as getting on 10 Meters when you don't have a
license and talking to ham operators. I don't think that's what C.B.
should be about, not to mention the fact that it's illegal. I'm not
going to lie and say I've never worked skip on a C.B. or talked out of
band or on a radio that was pushing a little more than 4 watts, but I
wouldn't recommend that anyone do this. Just my own opinion though.
Any way, I still enjoy C.B. from time-to-time as I grew up with it and
was looking for a good, reputable dealer online. I am planning on
changing jobs sometime in the spring and was looking for a good radio
with weather band that I can throw in the car when I commute to and from
work. They say the weather may get rough here in central Kentucky this
summer, that's why I want a C.B. with weather band. Can anyone help me
out? Please e-mail me and let me know. Thanks a bunch!

73,

Mike KU4UV
Lexington, KY.

Been there, done that...

Neat site, with a lot of 'tidbits' of info that can be very useful, but
really nothing that shows an understanding of how PLLs operate.
Just emperical data of the "do this and you get that" kind of thing.

>> can easily be changed to a BNC for use with a seperate car roof mounted
>> antenna.
>>
>> With both base and car roof antennas you can get a reliable 12 miles
>> from this old fashioned looking system.
>
>That seems a bit optimistic for only 1.2 watts/.7 watts. 5 miles
>reliable was what I've been told to expect.
You were quoted for just external base antennas, no? With external base
antennas and the handset on it's own telescopic INE 3 miles max.

By correctly modifying the handset with a 50R BNC and a properly tuned
1/4 wave mounted on a car roof you can see a genuine 12 miles. Naturally
this depends on terrain and height of base antenna's.

<snip>
>As transmit power goes up, the likelyhood of receiver desense also goes
>up, even with the separation of 20 Mhz. The amp has to be pristinely

>continuous duty rated, since a phone is full duplex.
Correct on all counts.

When running anything other than stock power we suggested antennas
spread apart at each gable end of the house, 20-40ft.

It was fun sorting out the duplexer and other filtering in the full-
duplex mobile amp running up a single whip!

The spectrum analyser does come in handy though it was not me that done
the work.
<snip>
>Back when our phones were limited to 1.7/49 Mhz, and little or no
>security codes, I used to "play" with a 49 Mhz phone and my 6 meter ham

LOL
>> His best to date, 57 miles. Though it was one way only and he had a 100w
>> LMR base amp at the house!
>
>I would guess that at 100 watts, the densense problem was taking him
>beyond the point of diminishing returns. For every extra mile that his
>transmitter was gaining, he was killing his receive.
Yes, we came to that conclusion.

We had a nice unit 280/340Mhz, 40w base, 6w handset. On the air for a
week or so and the Military police from a local Royal Air Force station
tracked my mate down. Told him to discontinue his phone service
immediately as he was interfering with navigational beacons using the
same frwq's.

No further action and he still kept the kit.

Anyhow, just my 2p.

I made plenty of friends, especially the country's farmers and half paid
for the house with profits over my years in that game.

Onto pastures new.

AM broadcast transmitters!

End of post.

Phil / UK

799. Re: NEW PRESIDENT REAGAN RADIO.....

Newsgroup: rec.radio.cb
Date: 2000-02-08 00:00:00 UTC

First off, I was not arguing with anyone. You replied to posts that pushed a button in your little warped mind and attempted to engage in one of two discussions in which merit is merely of personal reflection and belief, religion and politics. You bemoan of being relegated to the liberal media and hiss you "won't take it here". Great! Activate and direct the ignore function toward me, (Make sure you activate this device under your many assumed nics also. This is an entire subject matter on its own, but we all know why you do it) otherwise, you are taking it as expected. Never claimed I voted strictly Independent, reread the post. Says I'm REGISTERED Independent. I will refrain from hurling words directed toward you that come to mind when I visualize you attempting to grasp that concept. In all your political wisdom and prose, oh wannabe-sage-that-changes-nics, one might challenge the validity of your statement pertaining to the remark that it doesn't take much intelligence to vote Independent. No, it certainly takes more intelligence to cast your vote for the mainstream, the candidates that the LIBERAL media give us. This way, you really don't have to think for yourself, after all, the LIBERAL media is telling you everything you need to know about the candidates. Since you fail to comprehend my casting a vote to keep another out, it is pretty simple and I will explain it to you as I would a child. Example: Bush, Clinton, Perot. Perot never had a serious shot at the Presidency. That eliminates him. Clinton vs. Bush. The lesser of two evils. Didn't agree with everything about Clinton, but a vote for him was a vote against Bush. Pretty basic. The last statement should have read, "....begs to be resolved." Thank you for pointing out the grammatical error. McCain..wasn't he the Senator who released a horde of convicted VIOLENT criminals in Arizona a few years ago to make room in the ever burgeoning prison system for those REAL criminals who are making up the bulk of our criminal justice system, those horrid non-violent drug offenders? Yes...he was.

I have been reading this newsgroup for a couple of weeks now, and and still interested in getting a new radio with SSB. I have been looking at lots of webpages and the cobra 148 and the Midland 77-290 seem like pretty good radios.. on paper that is.. So far in this group I have only seen negative comments about them, with the praises going mostly to the Uniden Grant XL or LT. Is it that much better ?? Are the people who are putting the Midland and Cobra below it actually have both ?? or is it just something they hav heard ?/ I'm very interested in hearing from owners of all three, and especially someone who has had more than one and can compare...
Thanks

the answer to your question is no, and it is my own fault and not the fault of anyone else. are you going to start pointing fingers to explain your shortcomings there twisted. on that point , we americans work harder for less, and that is a fact. so why is it people don't get mad about taxation . heck a little over two hundred years ago , they got mad about a one percent tax rate. what is it going to take to get us mad this time? remember this government of ours is not as important to us as you think it is, but they want you to think that they are important. now don't get me wrong. some folks think that it is important , but they want someone to take them to the bathroom and hold their little tools while they take a piss. i do not. i like my independence. and i do not want to be hassled by a government that is supposed to be working for me and not vise versa. america is still free, but that freedom is waning, unfortunately. now having said that , your old buddy william jefferson blythe clinton has been trumpeting the fact that this is the strongest economy in 30 years or whatever. do you think he had anything to do with it? i think not. name one thing this sob has done execept issue executive orders. carter used to say, that he was responsible for more women entering the work force than any president. he used to wear that fact like a badge of honor. the trouble is women went to work because they had to . one check coming in could not support a family. listen, you sir are the one evading my question. my question to you is what is it you want from this country and what do you expect from it and once you answer that truthfully we can continue. whether of not , i am better off now is immaterial to this conversation , wouldn't you agree? i think you need somebody to help you figure out what is going on and your uncle dan is here to help,..cd out.....

He said for traveling purposes,that may or may not mean channel 19,he
may be traveling with another vehicle or want to BS other SSBers,I don't
know and niether do you.Anyway ALL SSB CBs have AM also.
Isn't the modulation limit 80% on the band?

I have never heard of a modern HF rig coming out of the box in anything other than perfect shape,they usually get screwed up by the owners.
I used an 840 last field-day a little and it is a great starter rig,I don't remember if it has a keyer.The hand mike will work fine but if you decide to use it in the house the optional scanning desk mike with lock sure is nice.I also like the alinco DX77.
When you get set up shoot me an e-mail and we'll have an on-the-air chat.

A cobra 148 IS a Uniden Grant that cobra puts their name on(for about
$10 more),same with the other cobras,cobra doesn't make radios.
PC122=146
PC76=29
PC66=25
etc.

Thats a lame reason, the big diodes are less costly than buying the leece Nevilles diodes and how big and cumbersome are they a 6"x6" box mounted under hood is not very bulky. The The benefits of external rectification far out weight and negative claims you have posted. Just Do It!

Greetings!

Gee Bob...let me know too...

All I've found are two definitions...I can't decide...

True Tech...

1. Uses common ordinary household tools and can use more elaborate
equipment for both destruction and repair;
Including, but not limited to;
Propane torch, Soldering Iron, Tig/Mig welding equipment,
Riveter, and some experience with Krazy Glue.
Is familiar with operation of said equipment and able to
reduce quality to produce quanitity [see: MODULATION]

2. Uses high technology tools to repair or replace equipment and
components of such equipment using this technology;
Including, but not limited to;
Oscilloscope, DVM, Soldering Iron, Power Supplies, Low Voltage
and High voltage operations and testing equipment, recognition
of components and substitutions or replacements of older
failing technology with more modern or current status-quo
devices.
Should have some experience in Krazy Glue, Peanut Butter,
Chewing gum, but are not considered pre-requisites.
[see CAPABLE]

Source record: 23439

Greetings!

Well, Midland has got a few things running for it - as long at you
don't set your expectations too high.

Cobra? Well, as long as you can understand Malaysian products, and are
familiar with the shortcomings of sub-standard component selection
[read: less than 100% prime] and can highten your awareness that you
and your hard earned cash are gonna get separated real quick...

You have to understand that "specs" are not truly interchangeable with
all the products listed. Some that say "S/N -40 dB" might be referring
to Signal to Noise ratio on an S-9 indication, and not the lowest
level you can actually discern a signal being out there.

While another will quote "Adjacient Channel Rejection Greater than
50dB", but another radio with say something like "Channel Rejection
>45dB at 100uV signal input". Which would you rather buy?

Thats the problem with "specs" there is a standard, but it's up to you
to interpet their tests and compare those results.

Midland does have poor rejection when subjected to excessive signal
from an adjacient channel, so do other brands. So, how "poor" is poor?

Like I said above, just don't set your expectations too
high - for any radio.

No CB is considered a "miracle" of science.
[But some come pretty close to performance you'd expect.]

The Grant is a lot better than the 148 these days, because it is made in the Phillipines. When the 148 was made there, it was better than the new ones from Malasia. Also below stated, a PC-122 IS a better TRC-465 and the 451 is a rare CB indeed. The President version or the Sears version of the 146 is better, even though it is the same board. Any one know WHY these is no sams info on this 146 circuit in any brand name?

I think this site is the best on the net for c.b. radio
needs.

http://www.coaxkid.com/index3.htm

This is also another good site:

http://www.copper.com

Copper sells some great stuff.

Stop by and visit us at the Outlaw DX message forum:

Source record: 23445

You have 2 questions to ask them. If they say YES to any one of these questions, DO NOT buy from them. It is that simple! Question #1:

1. Do you put in Modulation (Mod., Modge.,Swing) kits?

2. Do you sell "Northstars" ? (or any other Made in China CB's, like the current Cobra or RS trash!) If they do, DO NOT buy from them. Real North Americans don't sell JUNK CB's made in RED China. Why support pinko lovers?

The tune up probably voids the warrantee, but you won't need it with a Uniden CB. Also NO effect on the life expectancy of you or the CB, as long as you have a good SWR. But if you continue sinning, your life expectancy will be cut shorter!
Dave!!!!!!!!

Why mess up this Wimporer radio? Leave it at 12 watts & forgit your dummy mod. kits on ALL CB's & they will get out further with less splatter!!!! Remember, the WORST CB Shops in the country put them in. The Better & Best ones don't because they KNOW what a SCAM they are!!!!!
Dave!!!!!

Captain (Krunch?) BASEHEART of the 60's Sea View ! :

Are you Richard Baseheart, the captain of the real life 60's Seaview submarine? My question is, IF McCain is in the CFR or Trilateral Commission, does it really matter if we put him in or the Bush Drug family? And what about USSR N Seaview--did we give it to the USSR, that allegedly doesn't exist anymore?
Dave!!!!!

Captain Crane wrote in message <21246-389FFE0A-5@storefull-142.iap.bryant.webtv.net>...
I Vote for MCAIN for PRESIDENT...some people say that McCain has a bit of a Temper. But i feel we need a man with alittle temper to get things done...
We also need more military funding. Support on building the F22 and Other Top - Secret Military Projects. The Seaview needs some New Parts. Also the Clinton Years had led to less downsizing the armmed forces.. we need men to fight in case of a war... In the Last 5 yrs the Seaview had to LayOff many of our crew.
VOTE MCCAIN...
Regards

Capt Crane
USSRN Seaview

I owned a 840 and it is a neat little radio.
it has dual band stacked vfo's w\dds and also it has repeater tones for
10mtr and 100 memories
it put's out a full 100 watts .
it is yaesu bottom of the line radio and it doesn't have a bunch of bells
and whistles but for the money it is a good value I think new the radio
sells for about $800.00 and I have seen them used for $450.00
go to qrz web site and you will find a mod for the audio that will make that
radio jump
73" have fun

I thank you for the info on the amp . it turns out that it is in fact a 1
driving 2 driving 8.
We hooked it up to a guy's truck that had 4 huge alt. under the hood and 4
batteries and a 4000watt pep dosy and it dead keyed 200wts and swung to 2300
. the dude is going to give me a cool 100 buck's for it on payday again
thanks for all your help

Hey now! I've got a rare TRC-451. The circuit layout and design
is very similar to the 122. The 146/451 is prone to "gremlins"
and the 122/465 is the improved version.

Dave or Debby wrote:

How did you get a 2600 to go to the 11 meter band without changing the cpu, pll, or mixing crystals? The usual way is through the use of a chipswitch (aftermarket cpu). Unfortunately I don't have any particular solutions for you, except possibly to check to see that you aren't somehow in repeater operation mode.

Anyways, good luck.

i have the mod for a 858PLL chip don't know how many ch. it will give you but i will e-mail it to you sept by step how to do this mod. It is a very easy mod to do my e-mail is kc4sbj@hotmail.com make the subject cb mods. The only mod that i have that will give you this many ch. is the Cherokee mobile unit w/ssb these radios will go from 25.165 to 29.665 now that is close to 400 ch. Most people that do mods say that you have 40ch.am, 40ch.lsb,40ch.usb 40ch. cw, and 40ch.fm, and they say a radio like this has 160ch. this isn't true but i have the mod on 858PLL I don't know if this is the one you need but i will send it to you and you can try it.

hi.
I'll going to say one thing the ones that say it can be is full of
bull because it can be done you have to reprogram you if board to do
this but i would tell not to do this because it is hard to do ,I would
tell you to go get a rci2950 this radio has 2 vfo's this is how they do
it a cb radio don't have this. that is way it is hard to do it would
coast you more to set a cb up like this that it would be better to go
and buy a 2950,or 2990,once you set a cb radio up like this you may not
take it back without undoing this mod.

This was not a problem with the relatively low power, separate transmit
and receive antennas spaced well apart together with there being a 20Mhz
frequency split!

Nonsense. Have you taken a good look at the military lately? The military does not need more money - they just need to learn how to stop wasting the money they already have.

Lets give an example. The commander at SETAF headquarters in Italy says there is not enough money to put air conditioning in the enlisted quarters (the officers have air conditioning). However, the commander recently approved the purchase of a $6500 decorative rug to hang on the wall in the entrance to the headquarters building. That money alone could have purchased 25 air conditioning units.

And the $650,000 recently spent to renovate the Ederle Inn (complete with wicker furniture, fiberfill comforters, and satin sheets, in the rooms reserved for officers) could have purchased several hundred more air conditioning units.

Dwight

Exactly!

If you look at a BNC/TNC or a type "N" connector, you will see that the "shield" part is at the same approximate distance from the center pin as the shield of the coax that the connector was designed for, relative to the pin diameter. This gives the connector its rated impedence, which is good well into the UHF frequency ranges.

PL259 connectors do not have this "constant impedence" and will show up as a reactive component in the higher frequency ranges (We call it an "impedence bump"), which can alter the feedline loss, or antenna matching. At lower frequencies, this is not an isue, but it can be a big problem at 900 Mhz.

868. Help me choose the right beam antenna !!!!

Newsgroup: rec.radio.cb
Date: 2000-02-09 00:00:00 UTC
From: lzboyz@aol.com
Message-ID: <20000209091016.19655.00000808@nso-cn.aol.com>
Source record: 23469

I have been pondering on this for awhile.
I never ran a beam before.
Now that I`m getting my ducks in a row I am ready to spend $$$$$.
First let me tell you that the antenna will be on a tri-pod 10 to 12 feet above the asphalt shingled roof of my house.(50 to 55 ft in the air approx.)
I am looking at a beam length of no longer than 20 ft(horz)
I am leaning more to the dx side(not real concerned about local ground wave,but it would be nice)

I have checked out a White Lightning(4 element) Signal Engineering Quad.
I have looked at a 4 element horz mount with a stick antenna mounted above it.
I have looked at JoGunn Star antennas.

I`m kind of leaning toward the horz. mounted 4 element and stick configuration.
Is this a good choice??
I figure this would do well for local and well for the dx side.

I don`t really want to mount a beam with horz. and vert. polarization and a stick antenna on the roof.I guess this would be the best setup,but kind of a pain for me to install.I could go with the vert. and horz. polarized beam only, but I don`t want to turn it all of the time to monitor channels.

I guess what I`m really saying is "What the hell do I want??"

Please let me know what your opinion is or which setup you would install and why.
Sooner or later I`ll put this to rest and buy some stuff.

Thanx for your input.
Anything/everything helps

73`s
Randy

I`ll go one step further.
I will buy ALL old access cards you might have that are blue with a picture of
a satellite on the front.
Contact me by direct email if you are interested in selling.

I am willing to trade my Toshiba (Matsushita) 4X Write SCSI Internal CDRom Drive Manufactured in 1998 that works excellent for any one of the following good working items.

Kenwood TM-441 UHF Mobile
Kenwood TM-541 1.2ghz Mobile
Uniden/President HR-2510 (No mic OK)
Uniden/President HR-2600 With the Chipswitch (No mic OK)
Galaxy AM/FM/USB/LSB/CW Mobile IE: (Pluto, 88HL etc...) (No mic OK)
Also looking for a high power 6 meter mobile radio like the Kenwoods above.

Missing hardware is ok on all items.

email me with your questions
remove "no-spam" for my correct address.

Of course it is no good when skip is running, but that is not a
permanent condition, and also you and many other people
seem to think that the only antenna is the stupid rubber ducky
they usually come with--that is a ridiculous mistake. And
No, I would not say 10-4, as three days ago I talked to
a friend that lives about 20 miles away with my walkie talkie
hooked up to a--get this--magnet mount antenna and 12 amp
power supply. You know this is impossible when the skip is
rolling, but it wasn't and I did. I used to have a Midland
13-861 if I remember right and had it hooked to an 8'
Francis on my bicycle and used a gel-cel battery and
could talk quite a distance. The 13-861 was more like
a very compact mobil that had been factory modified to
use as a portable. I have used walkie talkies for many
years as mobils and as base units, the whole key is a
decent radio and a GREAT antenna. ;-)

Where might one find Noalox compound? I agree that attention
to detail can result in big dividends. I have worked on a boat with
all the problems that the salt water enviornment entails, and found
that there are tremendous difficulties whenever there are two or
more different types of metals involved--in fact I remember having
my brand new Jeep recalled because they had inadvertantly used
two different types of metal that connected together in a bayonet
type of connector that would last about 3 months and then corrode
to the point of non-function or an intermittent problem.

What do you want to listen to? A CB antenna works good for VHF low.
A discone works on all frequencies, but has no gain. A cell phone
antenna works for 800-900 MHz with lots of gain. Let us know.

Noalox can be generally obtained from electrical contractor supply
houses.

She has judged herself. When someone becaomes a Born Again Christian, they repent (turn) from all their evil ways and MAKE RESTITUTION to those whom they have personally wronged. I am not a veteran, but I know the Communist roots she has come from, and since we haven't heard of her great repenting OR saying "I'm sorry" for all her treasonous (not mistakes) acts she has comitted against this country and the Vietnam Veterans, I HIGHLY DOUBT IT that she is saved from her sins. The evidence is not there!!!!! I guess that divorce from internationalist reprobate Ted is required!!!!! Also she needs to ask forgiveness of all the Veterans she has gone against, by AIDING the enemy!!! Dave!!!!!!!

If I auctioned a fart on EBay, how much do you think I'd get
for it? After all 148 GTL's are going for $200.00.

I agree, I mean what is a PL259 refered to as? it is UHF connector, That is why I thought the guy was trying to hard to prove a point about something as meaningless as a miliwatt cordless phone.

All I was saying was that for what he was doing (extending the range of a cordless phone) that a pl 259 would of worked just fine, not that it was the best choice for a RF connector, but neither is the enclosure the phone is in. It would of worked fine. We are not talking about a 50 watts phone, we are talking about something that transmits very low power UHF.

Why do you NEED talk back? It never sounds like it does "over the air."
Put headphones in a different radio and listen that way. That stupid
echo does sound different through a radio then a talk back speaker.

Nathaniel Johnson wrote:

yeh , but how do you know, how do any of us know? the news media have been strangely silent on the issue. I picked up on it while reading the Drudge report a couple of weeks ago. think about this . the left have used her for their poster child for a long time and she has dutifully served them. now she serves someone else. they don't like it , so they don't talk about it . so no one knows what is going on with her but it started about two years ago when her chauffeur started talking to her about it. now she attends Bible studies all the time. The tree huggers wanted her to go to attend a meeting on earth environmentalism the other day. She said she didn't want to go, that they are wasting their time, they would be better off reading the good book and praying . imagine that coming from the lips of hanoi jane. i never thought i would live to see it but it is there. dave don't be so quick to judge jane. cut her a little slack. sin is sin and we all pay for what we do. i think when you get into the area of attaching degrees to it , then you get into legalism. no one, not one of us deserve anything. the gift was freely given and it it can be freely accepted. we are all condemned as a result of what adam did. at the foot of the Cross, the playing field is level, whosoever will may come, even hanoi jane. so heck, allow her to talk to only One that can deal successfully with this issue, ...cd is out.......

>country has good and bad aspects. You have to decide what you value
>when judging which is better.
You are right there.

I've been to the US enough times to realise that, like taking the wrong turn off the interstate out of LAX.

I've also lived at the wrong end of the trailer park in down town Terre Haute, IN.

The atmosphere was electric. Right turn Clyde!

However, I consider I have enough business 'savvy' to build a business.

Another option I'll be looking at when over there in May is to invest in a small local radio station and help to build it up.

Unfortunately the immigration/fcc, I forget which, do not allow more than a 25% stake by a foreign national.

Phil / UK

Its an Eagle Spitfire 454 with a different name. It is made in the same factory as the Eagle, but because Coppers Electronics owns the " Eagle " brand name trademark, other retailers have to use the brandname Titan.
Or Dragon.

I am trying to set the SWR on a co-phase antenna I have 75 ohm coax
together I can get the SWR down to 1.1 1.2

But when I use a 50 ohm 5 watt dummy load to set each one, I get each
one down
to 1.1 good!!!!!!!

But check them together after taking off the dummy load it shouts up to
1.5 2.5
witch one do I go by.

use the dummy load or not ?

Greetings!

Not sure which antenna you have...

This URL might help...

http://www.firestik.com/Tech_Docs.htm

Just scroll thru and you should find what you need.

As far as a dummy load, I don't use one for tuning.

I simply check, if too long or short, take a little bit off of each
side *equally*, or add length [adjust coil spacing] on both sides then
re-check.

It's a pain - but you should adjust both sides in equal fashion, and
while both are installed.

I live in Norfolk Virginia, and the last snow storm made my cb antenna fall. I do not have a base unit anymore, I just use my 40 channel walkie talkie now with my base antenna, but I want a good SSB base unit for a low price. Anyone know of one? I do not think that I will put my antenna back up until I find a good base unit again.

I'm clear,
Jdzieds(aka the popcornman)

Actually, the General-to-Advanced increment gives you much more addition
spectrum for the effort than Advanced-to-Extra does. If you like to
work 75m DX in the "window" (3,790 - 3,800 kHz), you need the Advanced
rating.

If you figure in the price of pills it has saved by keeping an antenna from breaking down due to crummy corroded connections, then damn near its weight in gold.

And a situation that well deserves the number one slot on the list.
Good post, Donald.

Anyway, for everyone else, don't let the fact that we have run out of
numbers stop you from adding to this list. Many things could "tie" for
a position on the list.

Dwight Stewart

935. Re: Fallen antenna

Message-ID: <QYvo4.1189$R55.89346@news.uswest.net>
Source record: 23536

Well, there are a lot of different ways you can go. The least expensive
way I know is to run a used ssb mobile unit with a good power supply
and a great antenna.

I just bought an old Teaberry and a new 12 amp power supply along
with a copy of the old starduster base antenna for a grand total of
$166.00 I'll let you know if it works well if you want.

Some will dispute the Starduster, but I have used 7 or 8 different base
antenna setups and the top three were; Hy Gain Golden Penetrator 500,
Starduster, and the Astroplane--not counting the PDL II, or the Laser 400
which are both decent beam antennas.

As for the base unit, I would not know as I am happy with my old
Teaberry Stalker XX, although I understand that there are some
new ones that are good. The inexpensive way to go is with a
PC 122, and good power supply if you have one already.

You did not state how much you were willing to spend, and that
is ultimately going to narrow your options down to a few specific
radios.

I own a Cobra 148 & a Grant, the only difference I can tell between the two is that the Grant is marginally better than the Cobra at cutting out interference in the mobile. They are both very similar on the base and indeed those who I talk to on them can't tell the difference.

One thing that knob on the face of the box is a tuner. You use in to get maximum wattage from your box. I use a bigger SKULLCRACKA box out here in the grass and found out that these box's talk if you use them correctly. You have a good box you just gotta work it. The Man In The Grass With The Big Skullcracka.

Well here's another one for you: "The National Citizen's Band Center". They had a flyer in the box with a Maxon I purchased a few days ago. Membership is "only $24.95". For this they offer to reissue an FCC callsign you previously held, list your call, handle, and name in their Who's Who of CB, accredit you as an emergency monitoring station, a free 1 year CB publication... the list goes on! They say they are not affiliated with Maxon either. They also claim "... the club that represents CB Communications in Washington, DC. I've been involved in all forms of the radio hobby for many years, get all the magazines, read this group regularly, and have never heard of these guys! Has anyone else?

Frank,

There is not alot of choices around. I did buy my crank up tower from Amateur Electronic Supply. I contacted many tower manufactures and found that US Tower had the best crank tower for the dollar... Telex was liquidating all of there towers and they may have some light duties laying around. I would contact them directly. That's what I did. Just that there wind load capacities would not work for me... Good Luck. Bill

I prefer sampling the signal, via a tap and seeing it on the scopemeter. I could care less about
carrier, I much more care about the signal that rides on the carrier. What I like to see is a sine
wave that is with a smooth signal.

I also find that running an amp at the high setting reproduces more often unwanter harmonics that
your ever loving Dosy, dosn't see.

Second, someone correct me if i'm wrong, but dosn't a dosy use diodes to demodulate the signal,
then filter the signal to measure the power. This is one of the cheapest methods used to measure
power. Use or borrow a meter that uses a themalcouple circuit to measure power, like a Bird wattmeter.

Do you have a DIN CD player in the vehicle? Where is the radio located in the vehicle? Where
does your Coax run? Did you say the antenna is mounted to a roof Rack? Does this roof rack have
bare metal contact with the vehicle? What other electronic equipment do you have near the radio
(Radar detector, Eq, etc..)? Is the antenna whip a fiberglass whip, or a Stianless steel Whip?

Possible Things that cause Radio interference: Tire static, vehicles Transmission, Alternator
Diode pack gone bad, Electric motors: i.e. Blower fans, winsheild wipers. Any thing that has a
Pulse Width Modulated power supply. Loose ground connections.

Sorry, but that is the most ridiculous idea I have read in a long
time. Sunspots are heading for a peak, and CB is becoming virtually
useless. The "S-9 of noise and heterodynes all day" is becoming the
rule across the entire country, including remote areas, because the
signals all propagate.

The ONLY purpose for which CB is useful is car mobile to car mobile,
and that is probably reliable for about a mile with no buildings in
between. And that goes for sideband, too. Ten-four?

I'll bite... why do they have black-history month? Or Hispanic reconition week? I would SURELY be labeled a "racist" if I proposed an "European-American" DAY ! I guess the shoe just doesn't fit. Or I'm just ANOTHER "whitey" trying to stir things up. Think about it... Gee, 150 years ago the IRISH were slaves! And during WW2, the Nazis made slaves out of ANYONE who was not German. My Grandfather was a Nazi "slave." And for his 'labor', he died before I was born. NOW WHO IS THE SLAVE ? Rest in peace Grandpa... I'll be with you someday. I think that as Americans, we need to put the past behind us... and look toward the FUTURE. And maybe try to learn from our past 'mistakes.' This is ONE world. The color of your skin should have NO BEARING on anything in life. It should be the BEST person for the job. PERIOD.

Why I do believe we agree on just about everything in your last post. I am not about to point any fingers because I AM better off than I was 10, or even 15 years ago. I would like to think it is because the hard work and perseverance I employ, but the truth be known, the last surge in the economy has had more to do with it. You regained my collective respect simply because you admit that you are not better off and it is no others fault but your own. Clinton is going to flaunt whatever he can to assist Gore. I believe we have the poorest choice of candidates ever. Of course, that is said each election. Many people do need to be told what to do and that faction of society will always exist, no matter what techniques are employed. There will always be those who feel government should be responsible for everything in their lives. Abdication of their values isn't an option for these folks. What I want from this country is already written in our country's founding documents. If the government would leave well enough alone and begin respecting our rights, bring sanity to the judicial system and sentencing guidelines, make one take responsibility for one's actions instead of placating blame on another party, get the hell out of the private sector, limit lobbying contributions, no, make that eliminate, impose term limits to congress after it is put to ballot, give equal air time to all candidates regardless of party affiliation or pac monies, utilize prison labor, cap insurance rates through streamlining by cutting the CEO and attorney's outrageous bonuses and fees, restore quality education to public schools and reinstall nurses instead of cops, and impose a high tariff on imported goods which would force American manufacturers to adjust accordingly, well, that would be a start.

hey doggy, thanks for the flowers but i assure you it was not uncle cd
that gave cb radio a bad name, it was that awful hillbilly that did
it , in conjunction with his partner in crime, william jefferson blythe
clinton. you have to keep an eye on those arkansas folks, they are a
real trip. now he is calling me his son. i don't even know the man.
anyway, moving right along, doggy, i don't know how much i had to spend
to educate your ass , but i definitely want my money back
slick,....this is uncle cd and i am back quiet.......

Be careful when comparing these radios. The Cherokee & possibly the "eagle" version are stuck in 10kC "channel steps" & you can't tune 1kC (28.305, 28.306, 28.307.....) The Titan will tune the 1Kc steps. I believe "Dragon" is actually the name of the company that makes the radio, but I have yet to see anyone in the USA selling the radio under the "Dragon" name........ http://home.att.net/~advancedspec/

Does anyone know of a modification for an RCI 2970 for increased modulation other than changing R178 and the mods in the RCI Bible? I would like to get the radio to swing from 4W dead key to 20W with modulation.

Thanks in advance.

John

cpu is original, pin 34 and 35 are joined together and the trace is cut to free the contact with the resistor pack, this opens the freqs. I did check the rpt and it is off, I think there is a communication problem between the cpu and the pll, I thought maybe someone has had the same problem with the 2600, thanks for the comment.

Have never used a dummy load for this. Just tune up each antenna using a single coax then put in the cophasing harness. I guess you could do it with a dummy load if you could get each antenna to a 1:1 SWR, but if you can do this you don't need the dummy load either. The idea is to get each antenna to the lowest SWR you can and have both of them the same.

>Why? This group has no more credibility than any of the other game
>players.

Why would you say that? They are a great group getting things done. They are currently petitioning the FCC for changes in the CB hobby. Complete information on these petitions are accessible on the USCBOA Official Web Site at http://home.att.net/~uscb_association/index.html

What are "the other game players" doing?

Andy, USCB-14
Area Representative, Newport, RI

October 30,1999

Alan Dixon USCB-52 has petitioned the FCC to amend Section 95 CB Rule 13, to allow Citizens Band communications beyond the current 250 kilometer (155.3 mile)
limit. This petition is the first step in many that are required in the FCC's bureaucratic
process. The very next step is for the FCC to assign a Rule Making (RM) number,
thus establishing a sort of preliminary docket.

The bureau in question (Wireless Telecommunications, Private Wireless Division) is
at liberty to dismiss the petition without any action, with or without apparent cause.
Alan doubts that this petition will be dismissed because this issue has not been
visited in recent years and this petition seeks a measure of "deregulation" which is
extremely politically correct at the FCC today.

Presuming that the FCC assigns an RM number, such action will be published in the
Federal Register and at the FCC Web site. Comment and reply comment periods will
open briefly, typically consecutive periods of thirty and fifteen days, respectively. If
the measure survives that, and having got to that point, Alan feels it will go to the five
Commissioners for a majority vote. Such a vote is only to establish a Notice of
Proposed Rulemaking (NPRM) docket. At this point, the actual proposed new rules

appear, verbatim. Again it is put out to the public for comment and reply comment.
Then, comments and possible further changes considered, the bureau staff will issue
a Report and Order (R&O) to the Bureau Chief for review. It may be tweaked, and
must be "rubber-stamped" up the ladder.

Finally, the docket goes to the five commissioners for a final collegial vote. They may
vote by circulating and signing the docket, or vote aloud during an open meeting, as a
regular agenda.

"Timing is everything, here" reports Alan. It typically takes the FCC three to six
months just to take initial action on a petition for rulemaking, and usually later than
sooner. Supporters of the petition need to be ready to speak... loudly, and quickly
too, when the time comes. More importantly, early inquiries to the FCC about the
matter may prompt earlier action, indicating that a public level of interest does exist,
so better to indeed put the item out as a full RM docket.

And here's the actual petition that was submited:

Before the
FEDERAL COMMUNICATIONS COMMISSION
Washington, DC 20554

Petition for Rulemaking
In the Matter of

Amendment of Section 95.413(a)(9) CB Rule 13
Prohibition of Communications or Attempts to
Communicate with Citizens Band Stations
More Than 250 Kilometers (155.3 Miles) Away.

Petition for Regulatory Relief of Burdensome
And Unnecessary Rule that Inhibits the Public's
Simple and Unencumbered Access to this
Communications Service.

GREETINGS:

SUMMARY

Although Subpart D Citizens Band (CB) radio is intended as a short range
communications service1, users should not have to concern themselves with the
possibility of inadvertently contacting another CB station farther than presently

permitted by rule. Further, CB operators should not be constrained from contacting
distant CB stations in order to facilitate communications necessary for personal
convenience, navigation, traveler assistance, and least of all emergencies and disaster communications.

The propagation characteristics of frequencies surrounding the 11-meter band are
well understood to be capricious2 and, in as far as the average consumer is concerned, unpredictable. Utilizing a consumer device such as a CB radio should be
a simple and unencumbered process. A user should need only to exercise common sense and courtesy, not posses a technical understanding of High Frequency (HF)
radio wave propagation, nor a regional geographic frame of reference limited to an
arbitrary radius.

DISCUSSION

Whereas; the Federal Communications Commission (Commission) has objectively stated that unnecessary and burdensome regulations should be eliminated or streamlined3.

Whereas; the CB Radio Service is intended primarily for use by consumers and small
entities4, rather than by trained or licensed operators or technicians.

Whereas; in spite of sporadic communications that do occur beyond the existing 155.3 mile limit, such communications will not substantially alter the primary use of
CB as a short range communications service. This has been well evidenced for decades, particularly through and during the previous and present 11 year solar cycle
peaks. Such long distance (DX) communications can and do occur on a frequent basis, with or without the knowledge of the operators involved. Such DX communications have not materially affected the given short distance purpose use of
the CB Radio Service, as demonstrated by the functional, actual everyday use of
short distance CB radio communications by such entities as over-the-road truckers,
automobiles travelling in groups or caravans, and neighborhood watch groups. Admittedly, there are times when communications from distant stations do interfere
with local communications. This occurs however, whether the distant interfering
station is communicating with a local station, with respect to the station being
interfered with, or with another distant station. There is little operational control that

can be exercised by any party in this example, except common courtesy under existing CB radio traffic rules relating to permitted communications and priority of
traffic.

Whereas; nothing in this petition seeks to permit the operation of other than presently type accepted or certified CB radio equipment. This petition does not in any
way seek higher authorized transmitted power output levels or expanded operating
frequencies or any sort of refarmed channelization plan. Additionally, nothing in this
petition seeks to change or add to existing modes of communication presently authorized in the CB Radio Service.

Whereas; CB communications utilizing authorized 12 watt Single Sideband (SSB) mode are more likely than 4 watt Amplitude Modulated (AM) signals to travel longer
distances by means of ionospheric reflection (skip)5. Additionally, these higher power
SSB signals are more likely to travel greater distances as ground waves as well6.
Therefore, it is even more difficult for SSB mode users to determine the range of their
communications without actually first establishing an errant DX contact.

Whereas; emergency communications should never be subject to any law, rule, or regulation inhibiting the immediate transport of such message to any station in a
position to render aid or to forward such message.

Whereas; disaster relief communications, including tactical relief logistics, health and
welfare traffic, and point-to-point communications between and among relief and
public safety agencies, organizations, and individuals need not be restricted from
making maximum use of the low cost and ease of deployment of CB radio equipment
to mitigate the effects of such disaster.

Whereas; motorists and other travelers need simple access to their CB communications without regard to having to assess their immediate location in reference to other potentially distant stations. This is particularly true for motorists
who are presently required to know not only their instantaneous location, but also
potential distances of stations contacted. The present rules require such traveler to
figure a dynamic regional geography extending well beyond 155.3 miles, in order to
avoid fear of running afoul of this regulation simply by keying the microphone

and
contacting the "wrong" station. Relief of the distance of communications limitation
will enhance driver safety by allowing CB operators, while driving, to complete their
communications promptly and thereby devote more attention to the operation of the
vehicle.

Whereas; CB calls and communications for the purpose of determining the utility and
operational ability of legally authorized CB station equipment and antenna systems
should be unencumbered of distance limitations. Such relief will enhance the value of
such test calls and communications, and establish operator confidence in both the
reliability and limitations of the band and such CB station equipment. Such on-air
testing including DX calling would not materially disrupt the existing, ongoing,
purposed, and predominantly de facto use of the CB Radio Service as primarily a
short distance communications service. Again, this scenario has been well evidenced
for decades, particularly through and during the previous and present solar cycles.
And still again, such DX communications have not materially affected the given short
distance purpose use of the CB Radio Service, demonstrated by the functional,
actual everyday use of short distance CB radio communications by such entities as
over-the-road truckers, automobiles travelling in groups or caravans, and
neighborhood watch groups.

Whereas; the absence of the 155.3 mile CB communications limit will serve to relieve
FCC enforcement personnel of a portion of their workload, freeing such resources for
more important enforcement issues such as dealing with cases of patent abuse of
the band including malicious interference, profaning, and music broadcasting.

Whereas; until contact with another CB station is actually commenced, the calling
CB operator has no way of knowing if the station contacted lies within or without the
presently authorized 155.3 mile radius! Thus, inadvertent and otherwise innocent
violations of the 155.3-mile distance limitation do occur. Consumers must be
protected from this unreasonable, unnecessary, ineffective, and no longer

useful
regulatory burden.

SEEKING

Now therefore; this petition seeks regulatory relief by these means:

1.) Immediate repeal of 47 CFR §95.413(a)(9) found within CB Rule 13, herein paraphrased: "You must not use a CB station-- … To communicate with, or attempt
to communicate with, any CB station more than 250 kilometers (155.3 miles) away;"

2.) Modification of 47 CFR §95.413(a)(11) found within CB rule 13, herein paraphrased: "You must not use a CB station-- … To communicate with stations in
other countries, except General Radio Service stations in Canada;". This section
should be modified to permit communications with stations in other countries, subject to any restrictions or exclusions that may be imposed by either the International Radio Regulations of the International Telecommunications Union, or of
the government of any country affected so by. In any event, unrestricted distance of
CB communications must be allowed within or over any area of the world where radio
services are regulated by the FCC, including within the territorial limits of:
The fifty United States.
The District of Columbia.
Commonwealth of Puerto Rico.
The Caribbean Insular areas under the jurisdiction of the FCC.
The Pacific Insular areas under the jurisdiction of the FCC.
Any other area of the world, except within the territorial limits of areas where radio
services are regulated by-- An agency of the United States other than the FCC. (Subject to its rules.)
Any foreign government. (Subject to its rules.)
An aircraft or ship, with the permission of the captain, within or over any area of the
world where radio services are regulated by the FCC or upon or over international
waters. You must operate your CB station according to any applicable treaty to which the United States is a party7.

The present authorization to communicate with said Canadian stations must continue
to be embraced. Further, any rule change relative to this petition must clarify that
such communications with Canadian stations is always permitted, any extant distance of communications restriction notwithstanding, whether or not such had
been the original intent of §95.413(a)(11).

3.) Modification of 47 CFR §95.418(b) found within CB rule 18, herein paraphrased:
"How do I use my CB station in an emergency or to assist a traveler? … When you
are directly participating in emergency communications, you do not have to comply
with the rule about the length of transmissions … You must obey all other rules." The
statement "You must obey all other rules." is unnecessary, must be stricken, and
language inserted that adds in essence, "You do not have to comply with any rule
about communicating with or attempting to communicate with any CB station more
than any specified distance away." This change is necessary to expedite response of
emergency services in an emergency, so as not to further endanger life safety or
property.

4.) Modification of 47 CFR §95.418(c) found within CB rule 18, herein paraphrased:
"How do I use my CB station in an emergency or to assist a traveler? … You may
use your CB station for communications necessary to assist a traveler to reach a
destination or to receive necessary services. When you are using your CB station to
assist a traveler, you do not have to obey the rule about length of transmissions …
You must obey all other rules." The statement "You must obey all other rules." is
unnecessary, must be stricken, and language inserted that adds in essence, "You
do not have to comply with any rule about communicating with or attempting to
communicate with any CB station more than any specified distance away." This
change is necessary to expedite information of necessity or convenience to motorists
and other travelers.

The proposed rule changes herein are clearly in the interest of the public interest,
convenience, and necessity and appropriate to the new deregulatory momentum8 of
the Commission. Your careful and prompt consideration is greatly appreciated.

About the same, but not as much arm waiving. Your efforts are interesting,
but this thread is about the selling of bogus SSB callsigns.

To match the output of the tube (inductance and capacitance) to the antenna impedance, It is called a tank circuit. You should also have an input tune it dose about the same thing except it tunes your radio to the input of your amp

I tried one of the SP1A processor's. It may work ok with a stock or noise canceling mike, but it didn't get along with a D104. That was back when I was running AM, haven't tried one on SSB and never will. Once was enough.

Well alot of the cost of living in UK is due to the fact that people over there are willing to pay exsorberent prices for Gas.. houseing and so on.. if people woudn't pay houses at such a high price then they couldn't sell them at that.. then
what would have to happen.. the prices would drop surly

1012. Re: Help me choose the right beam antenna !!!!

Newsgroup: rec.radio.cb
Date: 2000-02-10 00:00:00 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <38A2994F.3C7168E7@island.net>
Source record: 23581

I had a 4 element Quad and a Starduster above, Best DX and
local combination ever. They were all on a 48' tower with an
26 foot mast and a Ham II rotor. A good 4 element Quad holds
the DX a little longer on the flat side than a Yagi.
Cheers,
John

When the term "UHF" was applied to a PL 259, 150 Mhz was considered
"UHF". Alot has changed since then. To call a PL 259 a "UHF" connector
today is just plain silly.

1019. Re: upd858 PLL extra channel mods anyone?

Newsgroup: rec.radio.cb
Date: 2000-02-10 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <xGzo4.8807$pH6.289538@newsread1.prod.itd.earthlink.net>
Source record: 23588

You didn't read the original post Al.

The uPD858 is NOT a 'CB channel' PLL chip, it is a 'generic'
PLL chip used in a CB. The 'implementation' of the uPD858
in the original request for help was for a TRC452, which is an
AM radio, NOT for a SSB radio. The design of a TRC452 is
DIFFERENT from the designs of the SSB radios. In fact, I
know of only ONE design for the uPD858 in SSB radios, and
while I only personally know of the one design for TRC-452
type radio as an AM design, I DO know that it is DIFFERENT
from the design in the SSB radios. And while I don't know
personally of other designs, I do seem to recall the 858 was
used in at least one other AM chassis, and there again it
may be different than the way it was used in the TRC-452.

Saying you know of one design and giving someone instructions
to 'cut and jump' is almost (but not quite as bad) as saying
you know how a microphone is used, therefore it's gotta be used the
same way in all rigs. LOTs of different ways to wire that sucker
up, even with the same connector.

The uPD858 is a BCD input decoder for PLL. That means it takes
NUMBERS as it's input. NOT CB channels. The uPD858 takes
number from 000 to 399. In BCD that's 4 pins for each number
and three numbers for a total of 12 pins. If you want to figure
it out, make up a chart and number it 1 - 40 down the left, then
have 12 columns. Set the radio to channel 1, and WRITE DOWN
a 0 or a 1 for 0v or 5v on each of the pins. Then do channel 2,
then channel 3, and so on. You will see the numbers increase
BY ONE for EACH channel with two exceptions.

One exception is the 'hops' over the class D control channels. These
are between 3-4, 7-8, 11-12, 15-16, and 19-20. Then the count will
NOT be in order when it does the sequence 22-24-25-23-26.

LOOK at your chart! NOW you can figure out how to 'enhance' the
coverage. If you can't, I'm not going to explain it here. If you can
spot the pattern, it should be obvious. THEN look at a mod for a
another CB set, and compare it to what you need. But remember,
the other CB set may not be using the same set of numbers you are.

Make your own CD's with this Matsushita 4X Write SCSI Internal CDRom Drive. I'm looking to trade it for one of the following items only or you may send me comments or if you have something I might be interested in, Leave me an e-mail message. I have 2 of these and don't need the second one. Drive was tested and writes excellent at 4X. It was also detected by Win 95 without any setup software and works great with "Adaptec EZ CD Creator". Below is my list of stuff I'm looking for:

Uniden/President - HR-2510/HR-2600 w/ chipswitch or modded PLL
Kenwood TM-441/TM-541 Mobile
Galaxy Export All-Mode w/ frequency counter
VHF Duplexers for repeater 145.XX mhz range
6 meter FM mobile radio (Kenwood, Yaesu or Icom etc...)

I will ship drive after receiving one of the above

73,
John (kf6foz)

1023. FS: Realistic TRC-212 40 ch Walkie-Talkie

Cross-posted to: rec.radio.cb,rec.radio.swap

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 35.00 plus shipping.

A Picture can be e-mailed.

Homer

I took my Saturn turbo to the man who can unbreak anything. Just as I suspected I fried the Micro P.

He said it would be cheaper to send the radio out but to whom? Galaxy only works on DX models. Ranger only works on RCI models. Is this Mr. Pings way of saying I'm fucked??

I can get a Micro P from RCI but if any one know who builds imports these radios let me know..

Source record: 23596

I'm looking for a CB which has separate squelch controls for channel 9 and another active channel, eg. 19. I have a dead Pace 8047 (circa 1978) that does this (did this before it died). I could set the quelch control for channel 9 way down to make sure I heard everything on that channel and set the separate squelch control for channel 19 way up to reduce the garbage on that channel.

Anyone know if any of the current CB's have a dual squelch control feature?

Im currently looking for an UN-MODIFIED, PRISTINE MINT, D201 (hand wired version) The only modification Im willing to accept is if the extra 17 channel's were installed, bringing it up to a 40 channel unit rather than it's original 23 channel's. Im very fussy about my equiptment, so please don't offer me abused, or heavily modified unit's. Just recently over the summer of "99" I found an IMMACULATE MINT Tram D201A, so I know somewhere, someone, has one for me. As a matter of fact... the Tram I bought even had the "original" Tram tube's in it !!!!! Im a collector of "Vintage" C.B. & Scanner gear, and over the past 25 year's or so Ive been fortunate enough to compile a pretty respectable inventory of beautiful equiptment, although most of my gear (that I use on a daily basis) is of the more modern standard's,.. I only use the "Tube Technology" stuff for transmitting over the C.B. band, (It's just a personal preference) I think it sound's the most realistic and of the pure nature, for duplicating the human voice. Well I guess Ive taken up enough of your time "babbling" so I will close by saying if anyone has what im looking for please contact me via my E-Mail Address, (I check this the most often) and I wish to thank you for reading this post, (I just hope this request is more succesful than my last on this Newsgroup) 73 Frank in CT.

1033. Quality CB Equipment for Sale

I can be reached by email. Rayjr@earthlink.net or by phone 301-625-1552

DaveMade 16 Pill- $1200 (Tuner added to tune swr inside of piece to any driver)

DaveMade 5 Pill with an extra set of matched pills- $400

DaveMade External Voltage Regulator- $50

Digital Volt Meter- $25

2- 200amp Powerline Altenators- $225 each

2- RF Meters- $10 each

MFJ Antenna Tuner Model 259B- $175

Bird Peak Reading Meter with 10,000 watt slug- $300

2- Heavy Duty/Deep Cycle 8 volt batteries- $65 each

Cobra 25 (better model for peaked modulation)- $100

Cobra 29 (better model for peaked modulation plus upper/lower freq)s- $125

2- Astatic D 104 Power Mic's- $30 each

TwoWatt Swival Mount- $65, orginal cost $125

2- TwoWatt 93"Coil Antenna's with quick disconnects-$65 each, orginal cost $110

3- TwoWatt fighting sticks set of 3 with quick disconnects- $75, orginal cost $145

2 Element Flat Side Beam *MOBILE* antenna with 18' mask/217coax/silver plate connector- $225 (orginally owned by Rodney King)

2 Element Flat Side Beam MOBILE mount and ball-$15

Astatic Power Mike D104-M6B- $30

Astatic Power Mike M6- $20

Varied lenghts of 213 coax connectors with silver plated connects- $5 each

1035. Re: upd858 PLL extra channel mods anyone?

Newsgroup: rec.radio.cb
Date: 2000-02-10 00:00:00 UTC
From: poofbutt@eudoramail.com
Message-ID: <38a309ab.2113822@news.gte.net>
Source record: 23654

Hi Mike!

I would mianly like the extra coverage. ie: Iam not looking to become
a PLL wiz really.

I found this page that looks like it has some good info:

http://trwc.hypermart.net/radio/modification/ecg1198.htm

I've yet to try it, but plan to eventually. Minor stuff (switches and
a couple of resistors) apparently.

Thanks to all for the replies - poofy

this is a question for the exsperts or whom ever has a suguestion, i have a 2950 with a palomar 225 amp(blue face) and a 102" ant , i have a good match across the band,my problem is when i turn on the amp ,my audio gets muffled?
im using a d104m6b mic my dead key is at 2-3w, is it that my amp is not getting enouph current ? the wire to the battery is 12 awg.
is this my problem? thank you all for reading

Message-ID: <ZeFo4.13510$Mk2.542083@newsread2.prod.itd.earthlink.net>
Source record: 23663

Just remember, you are changing the 'number' you put into the
uPD858. The resistors are (depending on design (and you
MAY need a few caps too!)) just to 'pull' the pins.

In cases where you 'break' an existing line, use a single pole
double throw switch with center off. The center of the switch
goes to the uPD858. One end goes to the original channel
selector, the other goes to the OPPOSITE of what the EXISTING
pull-up/pull-down does. That way, in the center position, the
pull-up/pull-down forces it one way. At the 'new' end, it forces
it the other way, and at the end connected to the original
switch, the circuit works as it did originally.

Any line that's totally 'new', then you use a single pole on-of
switch. HERE is where you 'probably' need to add a new
resistor and cap. The resistor pulls the line to say 5v, and
the switch grounds it out. Probably. That's the safest way,
in any case.

I had a similar problem on my radio. I had turned the deadkey down to 1 watt and it did not solve the problem. I upgraded to 10 awg wire and it did not help. I noticed on high power it showed a back swing on and average power meter. I took the amp and had the internal wire inside it upgraded to 10 awg and changed my quick connects and it solved the problem. I was using the same palomar you are. The amp does still sound much better on medium power than high power.

Antenna Specialist got out of the cb antenna business about two years ago. I was a distributor of their products.

We still have the Moonraker IV and the PD II Beam antennas in stock yet but the Super Scanner Antenna was discontinued a few years ago and this item will be very hard to find.

> appreciated.

You probably wont have any luck with this idea.
The tv switcher is 75 ohm for one and wont handle the power from
your cb for very long.
You can try it but I don't think it'll work for long.
You can however use a toggle switch of ample current rating to
do this. You can use any kind of metal box with the aprop.
connectors on it and short straight wire connections to/from the
switch.
The switch can be almost any decent hi current toggle found in
most hardware or automotive stores. The trick to switch longevity is
to not hotswitch the antennas. Don't switch while txing.
Good luck BobC

> sbf243
>
Two things to consider. First, how good is the swr between the
amp and the radio? Secondly, how much is your amp putting out dead
key. It is possible that the amp is already putting out close to
full with even that small a drive, leaving no headroom for some
swing.
If the second case is the problem I would question the accuracy
of your meter. The rig may be putting out more than that and
overdriving the amp. Also, if the swr is poor between the rig and
the amp the radio may be detuned and putting out more than when run
alone.
12 ga. is borderline for the amp but if the run is short it
shouldnt be a big problem. I would opt for at least 10 guage.
Good luck BobC

Here is an old trick you can do
rewire the tube sockets to use 6LF6,6LR6,6KD6 or there are lots of others that will work 6LF6 is the best in my opinion, they use the same tube socket BUT YOU HAVE TO REWIRE THE BOTTOM OF THE SOCKET!!!!!!!

you can E-mail me if you need to know the wiring diagram.also BE CAREFUL!!!! there are around 1000 volts down there enough to bust your hart open!

I don't mean to scare but I just wount every one to know not to go messing around in there if you don't know a little about what you are doing.

Only to boobs who put linear amplifiers in the cb section they just look for
the words linear and amp or amplifier in the cb section and off they go.
Put them under ham radio section and list as a 10 meter amp and don't put
the letters CB in your title or description and it will stay on.
Its not all that tricky and don't worry any one that wants 1 will find your
auction by just doing a search for linear,linear amp or linear amplifier.
Wilbur

Mike, re:

>The design of a TRC452 is
DIFFERENT from the designs of the SSB radios.

Yes it is. However, the same "formula" for extending channels is the same,
except the results aren't as great--but more than satisfactory for AM...

This guy sounds like the typical "98 percenter" CBer who lives in a trailer park, drives a primered 78 Nova, is on welfare, has 5 kids to different women, votes for Democrats, is a left-winged liberal thinker and has absolutely no clue whatsoever about politics, let alone the Reagan era or anything related. Take a look at our current president. I know, you're going to say something like "our economy is better than it has been in a long time...and unemployment is at a low peak", but this my friend is a DIRECT RESULT OF REAGANOMICS. What happens 20 years ago still affects Wall Street and the business/financial world. In 20 years from now, wait and see what happens. MArk my word, if you don't belive this, look back for as many years as you can in history and you will see this.

FCC Affirms $20,000 Fine as Unlicensed Operation Continues
NEWINGTON, CT, Feb 10, 2000--The FCC has affirmed a $20,000 fine levied on a Florida man last summer for unlicensed operation, willful and malicious interference with Amateur Radio communications, and failure to let the FCC inspect his radio equipment. The FCC's January 28 Forfeiture Order gives William Flippo of Jupiter 30 days to pay up or the matter will be referred to the US Attorney.

Following an FCC Warning Notice, Flippo initially was notified of the fine last July in an FCC Notice of Apparent Liability alleging violations that occurred the previous month.

Hams in Florida say Flippo has thumbed his nose at the FCC and has continued to flout the law by interfering with local HF and repeater nets. FCC personnel from the FCC's Tampa District Office have followed up on complaints from amateurs that Flippo--also known by his CB handle of "Rabbit Ears"--has regularly interfered with hams on 10 meters, 2 meters and elsewhere. The Order acknowledges that the Commission has received information on "at least five occasions" since the fine was levied last July indicating that Flippo continues to violate federal law.

Flippo's only response to last year's Notice of Apparent Liability was to send the FCC a copy of a one-page bankruptcy filing, "presumably as a claim of Mr. Flippo's inability to pay the forfeiture," the FCC speculated in its Order. The FCC was not impressed, however. "In a case where an NAL has been issued and the recipient continues to engage in the same conduct, we are not inclined to adjust the forfeiture amount, even where the recipient has filed for bankruptcy protection," the Commission said.

One Jupiter-area ham who has cooperated with the FCC investigation alleges that Flippo has been causing problems for the Amateur Community in his area since late 1997. He and fellow members of the Jupiter-Tequesta Repeater Group want to see the FCC take a stronger stand in the case.

"I want to see the guy in jail--plain and simple--and his equipment confiscated," said the amateur, who did not want to be identified by name fearing retaliation from Flippo. "The problem is, we're all playing by the rules here, and this guy goes out and buys a radio and he gets on there and does whatever he wants and brags about it." The FCC's latest action affirming the fine and ordering it paid is all well and good, he added, but "it's taken an awful long time to clean up." The Jupiter-area ham alleged that Flippo was QRMing local hams as recently as this week. "He's not giving up," he said.

FCC personnel from the Tampa office have visited the Jupiter area at least twice last year as a result of amateur complaints alleging malicious

interference from Flippo, primarily on VHF but also on some HF amateur bands as well as on 11 meters.

In its earlier investigations, an FCC agent used direction-finding techniques to determine that intentional interference to amateur traffic "was occurring and that the intentional interference was being transmitted from the residence of William Flippo."

The FCC has said the agent monitored and heard taped portions of a 2-meter ham radio net earlier that day being replayed on top of amateur communications on 10 meters " in an attempt to intentionally disrupt and interfere with those communications."

The FCC agent, accompanied by a local sheriff's deputy, attempted to inspect the radio equipment at Flippo's residence last June 8, but Flippo reportedly refused to allow the inspection. Flippo also is said to have radio transmitting equipment in his vehicle.

Radio Shack TRC-495 40 - Channel CB Base Station Transceiver. Practically brand new, this is a compact, 40-channel CB specially designed for use as a Class D citizen's band base station. I used this station for about 10 or 15 hours total and grew disinterested in the idea of CB Radio. You can operate the CB from either 120 volts AC or 12 volts DC. The CB also has the following features: - Large Analog Meter - Scan - Seeks out other CB users by searching through all channels for transmissions. - Switchable Noise Blanker. - CH9 Switch - Channel Display - Shows the selected channel in large red digits. - NB, ANL, and SCAN Indicators - Show you when you are in the Noise Blanker, Automatic Noise Limiter, or Scan mode.

I would appreciate any advice, this radio is box stock and works perfect on SSB but on AM
it starts off keying about 10 watts with low audio and before you know it. it is keying 20 watts with no audio anyone with advice on what could be the problem please respond or E-mail me thanks in advance
Tim

And the strange part is that you would have 66 of these phrases fresh in your mind, Galaxy. Perhaps you've been spending a little too much time listening to your radio. I heard that, I did. :-)

Source record: 23830

From Silly813........

Dear white fella,
ETC, ETC, ETC, >>

OK so now I know, and can explain..........

Surely you may have noticed Ice Cold will post jokes from time to time,
(from his post, you found my address) I find his sense of humor very
close to my own..........in order words I laugh at what he does. So,
when I receive, find, or see something that gives me a giggle, I'll pass it
his way, since *HE* has the reputation of posting humor on the CB board.

If it makes US giggle........then he will post it. I'm just the wholesaler,
the
supplier, rarely, sometimes the manufactor (and not in this instense)
And when he posts it around, I get to giggle twice........thats all.

Now my big buddy over there where they talk fuunny is very gracious.
He'll post my address as the original donator of the humor for the
board, giving credit where credit is do. Personally I don't feel it necessary,

but I'll never tell him what to do, or not to do.
Being a Chicago Polock, I have no problem reading something
two times, laughing at it twice, and not realizing where Ice got it from, LOL!

So in closing, this is by no means my own personal writings, my beliefs,
nor personal agruments with no one, it is only humor, at it's finest in my
own opinion. I truly belive that we ALL need to chuckle in our daily passings
since a giggle or a chuckle puts a smile on all faces, and to hell with our
problems at that moment.

The joke you question may have seem like a racial slur to some. To those,
I say, wake up, facts are facts, truth is truth......(I am in no way implying
you) we all need to laugh. Laughter will soothe the meanest of souls. And
for this reason, I truly thank Ice Cold and the Internet for bringing a wiggle
to my belly when I giggle.

I hope YOU don't take this impression wrong. I'm just saying......laugh,
life is too short. I've yet to attend a wake where there was humor.

P.S. ya know any good Polock jokes?

ICE, ICE, AND MORE ICE MR. ICECOLD BIG APPLE TREES JUST GOT DOWN........

1113. Re: upd858 PLL extra channel mods anyone?

Newsgroup: rec.radio.cb
Date: 2000-02-11 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <YIUo4.343$zE2.13390@newsread1.prod.itd.earthlink.net>
Source record: 23832

If you're talking about changing the least significant bit of the BCD input to the chip to get at the old R/C channels, yes.

If you are talking about the 'technique' of how to control a specific line to the PLL, yes.

But if you are talking about a specific 'line' to enhance frequency coverage, no.

It wouldn't be an issue if most of the 'hacker' instructions told you what they are doing. But they don't. And I suspect that more than 99% of the 'expert' people that spout about these mods don't know what they are doing, just a list of "do this" kind of thing. THAT is why I would say "NO!". It's not rocket science, it just takes a few minutes to figure out, but the problem is some of the very basic information needed for the average person to begin to figure it out is non-existant on the web. At least, non-existant on most web pages.

There are 10 repeater frequency pairs. They are 10 Khz apart with
a 100 KHz negative offset. Most use PL tones. My favorite one to
listen to is 29.66. I hear folks talking from CA to PA. The Republic
of Texas has a 100 watt station that comes in full quieting in MD.

1120. UPDATE:WTT: 4X Write SCSI CDRom Drive

Newsgroup: rec.radio.cb
Date: 2000-02-11 00:00:00 UTC
From: cobrano-spam@budweiser.com
Message-ID: <38a42382.2396774@news.thegrid.net>
Source record: 23839
Cross-posted to: rec.radio.swap,rec.radio.cb,rec.radio.amateur.equipment,alt.ham-radio.vhf-uhf,alt.ham-radio.marketplace

I am willing to trade a 4x Write, SCSI Internal CDRom Drive.
This drive was manufactured in February 1998, Bought in November 1999
with another exact type drive. Since I have 2 of these, I am getting
rid of the other. This drive writes at a fast 4x and works excellent
with "Adaptec EZ CD Creator". I was told that this was a "Toshiba"
drive but the actual manufacturer is "Matsushita". I have tested and
it writes fast and was detected by Windows 95 without external
drivers. On a scale of 1 to 10, this drive is a 9.5. No scratches on
the face whatsoever. I am willing to trade for any one of the below
items:

Uniden/President HR-2510 or HR-2600 w/ chipswitch or modified PLL
23 centimeter, 70 centimeter or 6 Meter FM Mobile rig (Kenwood, Icom
or Yaesu etc...)
VHF Duplexer for repeater (145 mhz range)
Galaxy Export Radio (AM/FM/USB/LSB/CW) w/ frequency counter.

Here is a picture of the drive.
http://members.xoom.com/cobra269/pics/CDRom4x.jpg

Cosmetics are not of prime importance but all controls must work and
radio must be in good working shape. I will only send the drive after
I receive the above item and will ship same day. E-Mail me with your
questions or for more info:

I use it on the ham bands, it's popular on 28.120 USB, very effective especially at low power levels. Most people use BPSK, but I like to try QPSK too. Easy to set up, all you need is a transceiver and a computer with a sound card in it. Software is free to download. The signal sounds like a deadkey carrier, but if you listen closely, you can hear it warbling a little. I'll listen for you on 27Mhz and see if I can hear you. What is your QTH?

>

I think what Mike is saying, is that the divide by "N" ratio is different for SSB rigs than the AM ones. So the pins that become "important" for adding channels may differ, depending on how the channel selector is arranged.

If you plan on ripping out the channel selector completely and replacing it with a set of BCD thumbwheels, then the only thing that will be different, is the number that equates to the actual frequency (the SSB rig's BCD number is actually very close to the actual frequency. Using A BCD adder, or changing the mixer crystals will allow you to "dial in" the actual frequency on the thumbwheels). If you plan on only "augmenting" the existing channel selector, with additional switches, then you have to decide which pins fill in gaps in the truth chart that the channel selector doesn't cover, and that IS different between SSB and AM implementations of the 858.

Signal Engineering makes an antenna that works like the Super
Scanner did but it is built a little different. Same idea and
performs as well but looks a bit different. They have a website
but I don't have it handy. Run a search for Signal Engineering
and you should find the information on them.

then why do they have type "N" connectors? pl-259 are not good for uhf and above especially where your poweris low such as the case of the phone who's output is probably measure in hundredths of milliwatts. there will come a point of diminishing returns where the amount of coax used to raise antenna will negate the gain from the added heigth unless a very low loss cable is used or more power is added to make up for the loss, or a higher gain antenna is used.

1144. FS: capacitors, tubes, sockets, sweeps, vacuum relays, MORE...

Newsgroup: rec.radio.cb
Date: 2000-02-11 00:00:00 UTC
From: ovrreactor@aol.com-nospam
Message-ID: <20000211183722.22406.00003171@ng-fh1.aol.com>
Source record: 23913

I've moved my "Tom's Online Garage Sale". I merged it with one of my "other" websites. There's a ton of stuff that I'm selling, like capacitors, tubes, sockets, vacuum relays, and tons of other stuff that I just don't have room for. Go to;

http://members.aol.com/ecc81

Also, I listed a whole bunch of capacitors on eBay last weekend. No reserve, most opening bids are $0.50 for the entire lot, some of them have opening bids of $0.01, just because I WANT MY GARAGE BACK! Auctions close this weekend (some Saturday, some Sunday)! To see the whole list, go to;

http://cgi3.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=over-reactor

Here are the lots that I'm auctioning off;

(40) 1800 uF 16 V axial capacitors
(75) 2000 uF 12 V General Instruments axial capacitors
(120) 175 uF 15 V axial capacitors
(2700) 5 uF 12 V General Instruments axial capacitors
(100) 150 uF 25 V axial capacitors
(75) 10 uF 10 V non-polar axial capacitors
(100) 150 uF 35 V RCA/Mallory radial capacitors
(40) 1800 uF 16 V axial capacitors
(200) 33 uF 16 V radial capacitors
(100) 68 uF 16 V Elna radial capacitors
(100) 1200 uF 20 V radial capacitors
(425) 47 uF 40 V radial capacitors
(120) 47 uF 16 V radial capacitors
(300) 150 uF 15 V RCA/Mallory radial capacitors
(75) 200 uF 6 V Ducati axial capacitors
(150) 5 uF 3 V non-polar General Instruments axial capacitors
(75) 50 uF 20 V General Instruments axial capacitors
(50) 30 uF 60 V Mallory axial capacitors
(190) 330 uF 16 V Nichicon axial capacitors
(125) 220 uF 16 V ICC axial capacitors
(75) 20 uF 100 V Mallory axial capacitors
(350) 25 uF 10 V radial capacitors
(150) 25 uF 15 V axial capacitors
(44) 100 uF 63 V United Chemi-con radial capacitors
(90) 10 uF 25 V axial capacitors
(100) 22 uF 35 V radial capacitors
(240) 25 uF 3 V Ducati axial capacitors
(400) 200 uF 6 V axial capacitors
(600) 25 uF 15 V Mallory radial capacitors
(180) 100 uF 15 V Mallory axial capacitors

You really believe that Morse code is that important? How can you be so out of touch with reality?

Your post is laden with hypocracy and insesitivity, and proves that this move was long overdue.

It is really hard to believe that this kind of post isn't faked, to try build up the no-code position(which I don't approve of, by the way).

1148. service manual or Sam's

First of all the requirements were needed to screen the bad element out.
Through the last few years we've seen the quick fix policies enacted even in
our state laws. That's why we spend so much time repairing laws and our
kids are so out of control. THE QUICK FIX POLICY. I'm for the new license
requirement change as long as the FCC monitors and fines violators.

My thought,
N5KOOU

Ok fellow amp builders, you know who you are, what am I doing wrong this time? Just built a 4 pill, 2sc2879's. I am using a #465 trimmer tuner on the output and I was getting some pretty bad flashes across the thin layers of insulaters. It only did it at 18 volt and not 13 volts. ran fine at 13-15 Volts. I understand the higher voltage effecting it but damn!

I am using 4 turns of wire in the T1 with 980 pf and 4 turns on T2 with 1300 pf. I am using a #464 on the input trimmer as well.

So now what? is it so much voltage that I need to go to a air tuner? Any input suggestions please....

You have voltage breakdown.

The obvious... Try another cap.

If it still does it, you might have a harmonic problem... I assume that your using RC feedback from the collector to the base?

If not, put some on it!

And then, if you still have troubles, let me know.

Morse code is just another mode, one that I am very fond of.. The code
requirement
should have been left in place simply as a way to ensure that someone who
achieved
extra class as least had to work a little bit.. The current "technical"
exams are so silly,
that anyone who has any kind of a memory at all can pass with no problem.

The FCC (and ARRL) has just helped ensure the demise of amateur radio..

More numbers does not mean a better service!

Just my thoughts.

Steve Cuilhe'
WA6GSD
Extra Class since 1976 and proud of it!

Mabe go to a #464 instead? little less capacitance on the output.

> If it still does it, you might have a harmonic problem... I assume that

yes I am using a feedback network 75ohms in series with a .01 disk cap
across base & collector.

> And then, if you still have troubles, let me know.
>

Ok I will put another cap and mabe I should go to 100 ohms on the feed back
network. I will get back with you on this.

I have 3 radios that I need to know the value of. 2 Cobras, 1000 and a 148 (right numbers) Both were modified for upper and lower freqs, and a Galaxy Saturn. (these rigs are from my teenage years and I'm 2x as old as I was when I got them. All are pretty beat up, if I remember the 148 needs to be repaired, The 1000 (2000 minus sideband) has no cover, no side speaker and the silkscreen is gone on the panel, I don't remember what, if anything is wrong with it. the Galaxy wouldn't stay on frequency. If these radios are worth fixing, or have any value, please let me know by email.

HEY JOE,
My Boss is one of those extra class whiners, you seem just like him,
everyone is below you because you are an extra class operator, whoop de
do. You are one of the same idiots that beat everyone down because what
you have or do is always better than anyone else. I look forward to
running into you at Dayton, I'm sure I will be able to identify you by
the stupid ass shirt you will have on. Just curious, are you a tightwad
like most all the rest of the xtra class people out there, you know,
the ones that beat you down on price for a piece of equipment, and spend
half the day doing it, only to piss everyone off and never buy anything,
no matter how low the price is. I bet you also step over a dollar for a
dime.... don't you?? I don't understand the big ego thing attached with
the license, but one thing is for sure..... you are the only one that
is impressed with yourself. I will leave you with a acronym, mister CW,
it ought to be real easy for you to figure out..... FOAD dickhead.

That would be sad wouldn't it. But then you only have YOURSELF to blame. You attitude has turned off the younger generation from giving one diddly about anything "old". All you have left is an elitist attitude. You mourn, but you do NOTHING to educate. You stand behind your past accomplishment, like it actually means something in today's world, and you expect anyone to give any concern to ANY of your values?

It is TRULY AMAZING that you can't see this. I can't believe you guys haven't lived long enough to have been on the other end of a similar experience.

Why don't you post some facts about W1AW, like some others did here(and please don't use a condecending attitude) - maybe you'll actually start to help bridge the gap, and pass on some of your values. When I first started getting interested in ham radio, I remember reading something about him in an ARRL book I think was entitled "Introduction to Amateur Radio", or something like that. I passed the book onto somebody else, and never got it back(but that's OK, I hope he passed it onto some other new ham).

D band is regular CB all others are good listening to. You can hear other CB'ers on some of the upper bands.
IT is fun to listen to all that goes on. Some folks take offiance at you being on their channel but you would be suprized what you find there that is not legal. I listen to all frequencies 40 upper, lower, AM, FM CW A,B,C,D,E,F. Boy what trash. Ham on 10 meters is no better or worse than CB on 11 meters AM. Don't get me wrong, there are good people out there too that understand some radio operators just cannot learn code.

I am one.

Taken from the RagChewers website

www.ragchewers.cjb.net

The Single Side Band Ragchewers are a group of people who for no other reason than having a good time on the radio, meet at least once a week on SSB frequencies 26.150,00 or 26.195,00 Lower side band. We welcome Hams and Freebanders to the frequency, and we always try to help out each other with radio questions and problems.

A good example of typical DXNet's that we have had would be 10-15 stations in 2.9.26.21.19.16.14.108 and 56 divisions. We all meet on either frequency 26.195 LSB or 26.150 LSB. Many stations would be working with Yagi's and many with verticals. All doing their best to beam the most central stations, usually 2 and 9 divisions, and 2 and 9 divisions beaming Europe. All having a chance to make contacts with each other during the DXNet. Many of us send EQSL cards during the contacts to save money and to confirm right away. Many of the stations are QRP and many are 100w stations, but we are all good mannered operators willing to help each other make the contacts

Wont you join us sometimes???

>will negate the gain from the added heigth unless a very low loss cable is
>used or more power is added to make up for the loss, or a higher gain
>antenna is used.
I couldn't of expressed it better.

Years back when I ran reasonably big power on the 144Mhz ham band from a
pair of QY4-400's I compared the power handling/loss of both PL259 and
'N' type connectors.

Even at this frequency the 'PL259' connector ran hot as compared to a
stone cold 'N' type.

I've always considered PL's to be 'Audio' connectors.

I convert all my equipment to 'N' type connectors , even down at HF
from the constant impedance angle.

Phil / UK

YOU MUST SE A DUMMY LOAD WHEN TUNING CO-PHASE ANT.'S.
YO MUST NOT USE 50 OHM COAX, SINCE IT WILL GIVE YOUR ANT SYSTEM A 23
OHM IMPEDANCE. A CO PHASE HARNESS MUST NOT HAVE ANY JACK (RCA,ETC)
CONNECTORS, BECAUSE OF IMPEDANCE "BUMPS". TUNE ONE ANT, WITH THE OTHER
COAX HOOKED UP TO A DUMMY LOAD, TUNE IT TO THE LOWEST SWR, THEN SWITCH
AROUND FROM ONE TO THE OTHER, THEN HOOK IT UP AND LET IT RIDE. IF YO
HAVE ANY QUESTIONS, YOU CAN CALL ME AT MY SHOP AT 334-964-7757, TINY'S
CB SHOP CB SHOP. BY THE WAY, IF YOU'RE DOING THIS SET UP ON A CAR, YOUR
WASTING YOUR TIME, OMNI IS THE WAY TO GO. CALL OR E MAIL ANY QUESTIONS,
GOOD LUCK, TINY

well I put in another trimmer cap and this time I dropped the T1 mica cap down to 330pf and had it working great for a while. Its was dead keying 300 watts swinging to a grand. Shot skip on it all day till finally. I was revving up to about 4000 RPM and had it locked down with Sand Man from the "Cold Great Lakes" when poof!!! there goes the pills. still keying watts so I know I didn't wipe out all quad. How many pill must we blow before we make the perfect box is the question? Back to the drawing board.....

Wrong, it shows that the state of the hobby is such that many don't
know or care who Hiram Maxim is.

Speaking of bankruptcy, since you brought it up, that is what the old
guard have attempted to do to ham radio. They came close to doing
this with their intellectual ineptness at moving ham radio into the
21rst century. Thank god that finally new life may be coaxed into
entering an otherwise dying hobby.

Any 148 type bracket will fit. Any radio that uses that aluminum chassis
has the same bracket layout. There are MANY radios with it.

Yes, you need an expander kit for a D2824 PLL. The 122 is a good
sideband CB. If you want expandability, buy a Grant. If you want
both 10 and 11 in one radio, I suggest a 2950. Others will say
2510. It's all personal preference. A 2950 is easier to modify,
and the new DX version will also cover 12 meters.

Newsgroup: rec.radio.cb
Date: 2000-02-12 00:00:00 UTC
From: xforce151@aol.com
Message-ID: <20000211233058.05441.00000827@ng-bg1.aol.com>
Source record: 23853

The 8950 tube was a 6LF6 with a 13.8 volt filament.

If you had an even number of tubes in the amp you could simply use 2 6LF6's with their filaments wired in series across the 13.8 volt 8950 filament supply.

You could either wire up a 'dummy' tube to drop the filament voltage on the 5th tube or calculate a resistor value to drop the 13.8 volt supply down to 6.3 volts for it.

Another very common practice is to series string all 5 tubes across the 120 volt supply line and use 20LF6 or similar tubes.

They are all internally wired the same as the 8950's and will work just as well.

For about $25 you should be able to ask for what is usually called a 'super mod kit', which basicly involves inserting a 'diode'. This enables a low dead key while allowing maximum forward 'swing'.

>If you are an ex W1AW what are you doing still hanging with the in crowd?

Apparently you didn't get the joke. W1AW was the founder of the ARRL, and is deceased.

Not that the post was funny. Those who have passed any amateur test can take pride in the fact. I'm confident the Extra Class operators will continue to enjoy the hobby.

I was shocked and suprised when this came in from the ARRL today.

MICHIGAN HAM YIELDS LICENSE UNTIL 2004 IN EXAM CASE

The FCC has cut a deal with former ARRL-VEC Volunteer Examiner Andrew Penn,
N8JVA, whose license was designated for a revocation hearing in the wake of
1997 examination irregularities in Michigan. A February 7 letter to Penn
from FCC Special Counsel for Amateur Radio Enforcement Riley Hollingsworth
affirms the terms of a voluntary agreement calling for Penn to turn in his
Amateur Extra class license for three years, ten months in lieu of facing a
license revocation hearing.

The FCC action stemmed from a June 3, 1997, Oak Park, Michigan, examination
session for which Penn was a VE and submitted the paperwork for applicants,
one of them Penn's son. As a result of an FCC investigation, the FCC
downgraded the license class of two applicants and canceled the license of
Penn's son, Steven A. Penn, formerly KC8HUM. FCC evidence indicated that
Andrew Penn added to the exam session package paperwork for applicants who
did not pass the required examination elements at the Oak Park session.
Evidence also indicated that Andrew Penn apparently applied to the
application papers the signatures of three other VEs without their
knowledge.

The FCC says that three of the examiners knew nothing of the scheme. The
other three VEs brought the situation to the attention of the ARRL-VEC and
the FCC.

The FCC agreement calls for Andrew Penn to turn in his license by
April 20,

2000. He will be allowed to request renewal of his license on February
21,
2004, the day before his current license term ends.

Now folks, I have a very hard time beleiving this is true. I mean, I
know Andy, I remember andy from the "old" days. When I first got in
to Ham Radio. from the Packet Radio days. I mean, I've talked to andy.
He was always kind, never said much. Just said hello and usually
signed out. He was ALWAYS kind to me, I just can hardly beleive that
he, of all people would have done something like this. I tend to
beleive that someone else did this and he took the heat for it.

I think andy should get some good lawyers and fight this in court!

and this is my honest opinion!

All 3 are worth fixing... The value of the radios depend on whats wrong with them. You state there beat up, the 148 might be worth $125.00 - $150.00 if it was in excellent shape, The 1000 gtl might be worth the same if was in excellent shape and since it doesnt have ssb. The Saturn should get you about $250.00+ if it looks good and sounds good but the frequency drift will kill some of the price. I would get back into them and fix them, or is that why they are in the condition they are in now? :)

Who is W1AW, it is the ham callsign of the Hiram Percy Maxim Memorial
Station in Newington, CT operated by the ARRL. Because of Hiram Percy
Maxim we have Ham and CB today, the US NAVY wanted to run all civilians
off the air after WW 1. The ARRL got congres to open up the airwaves
and the rest is history.

Chuck:
The facts of the case are clear: He forged his son's name on a test session and tried to pass off several others. He was lucky the FCC didn't go for the jugular and file criminal charges with the Federal Attorney. He took the suspension until 2004 to avoid losing his license in a hearing.

He is well known and seemed like a nice guy, I hope he will come back to radio in 2004. On the other hand, we must strive to keep the VE process clear of any fraud or favortism to make sure only fair tests are given.

what some people will do to get what they want. you know , if you want to be a ham, then go study and take the test , and if you don't pass it, then keep trying till you do. it makes no sense to me whatsoever for someone to cheat , just to talk on the ham bands. and then these same type guys get on the cb , and try and call attention to our collective 'ignorance ' as they see fit to describe it , and the use of illegal power. my , my. what a bunch. sometimes these guys are a real trip, of course you know and i know that they will have a hard time explaining the bad apples in their bunch but they are quick to point out the shortcomings of cb. oh well, this news comes as no surprise. now i know how that short-dicked hillbilly got his ham license. , he, he,.....curious dan, that is curious or cd for short but not for long and i am back quiet......

www.ragchewers.cbj.net

The Single Side Band Ragchewers are a group of people who for no other reason than having a good time on the radio, meet at least once a week on SSB frequencies 26.150,00 or 26.195,00 Lower side band. We welcome Hams and Freebanders to the frequency, and we always try to help out each other with radio questions and problems.

A good example of typical DXNet's that we have had would be 10-15 stations in 2.9.26.21.19.16.14.108 and 56 divisions. We all meet on either frequency 26.195 LSB or 26.150 LSB. Many stations would be working with Yagi's and many with verticals. All doing their best to beam the most central stations, usually 2 and 9 divisions, and 2 and 9 divisions beaming Europe. All having a chance to make contacts with each other during the DXNet. Many of us send EQSL cards during the contacts to save money and to confirm right away. Many of the stations are QRP and many are 100w stations, but we are all good mannered operators willing to help each other make the contacts

1256. 10 uses for an Extra Class License after April 15th.

Newsgroup: rec.radio.cb
Date: 2000-02-12 00:00:00 UTC
From: founder@arrl.com
Message-ID: <sa9bg5d2fo851@corp.supernews.com>
Source record: 23935
Cross-posted to:
rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.cb,rec.radio.shortwave,rec.radio.swap

Top 10 List.

1.) Let it expire.

2.) Give it to a retard, they're gonna your spectrum anyway.

3.) Send it to the FCC & tell them to shove it.

4.) Get VE accredited and help license CBers.

5.) Send it to the ARRL & tell them "Thanks for Nothing"

6.) Listen to retards talking in your spectrum.

7.) Modify CB's for your new ham friends & test their echo Mics.

8.) Brush up on your 10-codes.

9.) Teach new hams how to make a dipole and turn on a soldering gun.

10.) Place it in the toilet Bowl... then flush, a CBer will find it.

1265. Yet another AMP question

Newsgroup: rec.radio.cb
Date: 2000-02-12 00:00:00 UTC
From: breams4722@aol.com
Message-ID: <20000211224927.01119.00000336@ng-bj1.aol.com>
Source record: 23944

On an old tube type amp, it actually has(2) 30mb6's driving(5) 8950's. The question is how much wattage should I drive it with. The tubes are VERY old and I would hate to smoke these as they are hard to find and expense. I am dead keying 4 watts now but if I key in 10 watts...boy watch out, this baby roars.. But is that good??

Any help in great

>X-FORCE!!
>I won't tell who the party wes that called me!
>But i will tell you all that STEVE from EXPORTS-R-US is the one who had
>seid this....

First of all you were working back and forth between Bulldog and X Force. It wasn't long ago I spoke to you at the X Force Facility.

>I RELLY DON'T THINK THIS IS GOOD BUSNESS STEVE.....

Sure it is if you do work for both, if not then you need to concentrate on one thing and one thing only.

>BY THE WAY WHO EVER TOLD YOU THERE WAS A PILL SHORTAGE THAT WES A LINE OF"
>B.S."

Don't know what you are speaking of as for as a pill shortage. I just got 100 2879's in this week.
>
>I GUESS YOU NEED TO BUY TIME FOR CARL FOR MAYBE HE NEEDS TO TRY TO BUILD A
>BOX OR TRY TO COPY ONE!!!!
>
Carl is still doing fine with the units, if you not associated with X Force period, what is the big deal. You want to have a line of your own, well thats fine. Just remember who called who for some PARTS. I just sent 300 potientiometers out to X Force this week that I imported in.

>I'VE BEEN GOOD ABOUT WHAT HAD GONE ON IN THE PAST..

Sure and what you don't know is that I was just yesterday working on deal for you on some 8 pill boxes that we spoke about just a few weeks ago, oh well life goes on. You know what I am speaking of from the other email I sent you. My best recommendation to you is to get your feelings off your toes so they don't get stepped on so bad. You are capable of doing fantastic in what you do, but you are going about the wrong way on the wrong tracks.

>SO "DON'T EVEN GET ME STARTED"

Never mind we just spoke on the phone.

What kind off swing are you getting from the radio?What kind of meter are you using? If the shop did a basic tune up I would suggest a small amp if you want more power. Those radios are real easy to tune up.And the difference between 30 and 50 watts swing isn't worth the effort.

1268. Re: Yet another AMP question

You could have easily had 200 volts or more across that compression tuner cap.

Especially if there was a parasitic oscillation present that was not being absorbed by the antenna or dummy load.

Who really cares about you license. It sounds like you think CBer's are
a lower class citizen but I would advise you look in the mirrow buddy.
We have a right to use the frequencies that have been assigned to us.
Why don't get back into the real world and get a life. I think that the
radio waves have altered your thought process but get on with it..

1275. Uniden PC122 freq mods anyone?

Newsgroup: rec.radio.cb
Date: 2000-02-13 00:00:00 UTC
From: poofbutt@eudoramail.com
Message-ID: <38a60f94.2361145@news.gte.net>
Source record: 23744

Hi Guys!

Can anyone point me to a site online for freq mods for this critter? I found that it's PLL can get more freq's:

Can be modified by injecting new mixing frequencies with a external oscillator/crystal switch.

Does this mean I can put in a few crystals with a multiple position switch to get some added uppers/lowers?

Also, how easy can I get into 10 meters (28.3-28.5)? Besides enjoying CB, I have my ham ticket.

thanks - poofy

Ah, but it certainly has value in our world of amateur radio.
It's the second-most used mode on HF, but at times, one can
count more CW QSOs than SSB QSOs.

I can build a CW station from junk-box parts, and be on the air
communicating with amateurs around the world in a matter of hours.
Try that with any other mode.

73, Jeff KH6O

i have a 990v it's a ssb radio,large(nice)meter and freq counter.radio is my top shelf radio.clean LOUD awesome audio.would not hesitate to purchase another.had one minor ground problem due to a open to the radio chasis.5 min on the bench and putting the washers inside the brackets.i moved it in to the base with a computer power supply a bigstick on 15 foot of mast stuck in the ground and a little bit of help and i was overseas.
it talks the talk and walks the ducks.

Just got my 2990 back from the place I ordered it from for the second time. Had some problems.They said they fixed it again. Anyway the recieve still isn't right. When i am on the radio the recieve drops of from say 9db to 1db and then it will go back to 9. While this is all happening I can still hear other stations but they don,t come in as strong.Any ideas on what could be the problem? So far I think my old cobra2000 worked better. I got it from a place that has been seen on this ng. But i don't want to bad mouth them till i get the facts(i am pretty pissed off)
Thanks ken

They call it 'protection circuitry'!

Reverse polarity, VSWR foldback, current limiting, thermal trip et al.

Most, not all CB amp factories that I've come across know about these
but their inclusion does not earn dollars. A basic thermal trip seems to
be about it!

You tend to find them on the better quality ham units.

Phil / UK

sounds like RF getting back into the mic. Check the grounds and you might want to put a couple of ferrite beads on the mic wires on the microphone end of the mic cord.

What you heard were complaints about an arbitrary fence that the FCC has considered obsolete for quite some time.

What I'm hearing now are a bunch of petulant crybabies screaming that "it ain't fair!" when someone else gets something without having to jump through the same hoops that you had to.

If you don't see the difference, then I can't explain it to you.

Funny, I keep seeing somewhat related posts on
many CB and ham sites. As far as letting you
license expire, I did in 1980 - along with my
commercial 1st class telephone license and 2nd
class radiotelegraph license with radar
endorsement (I was too young for the 1st class
when I took the test and never did use the
ticket). In 1993 I decided I wanted the tickets
back - a trip to SUNY Alfred for the GROL and a
session with the VEs netted my my GROL and extra

- despite not being on the air since 1969 or 1970 and not checking any Q&A manuals. Oh, the code was a bit shaky, but I wrote a morse code send/receive program, just for fun, and doubt I would have trouble with 30 or 40 again.

Morse is obsolete; what bothers me is the attitudes many of us develop towards lower class licensees and/or CBers. I presume that those people answering posts such as these are likely on the internet (make that they ARE on the internet) and are probably computer literate. Sure there are many aspects to electronics and radio - a big one is the digital realm and some folks just might be surprised how computer literate these people are. I think I get a bit uptight with some of the rantings since I am now over 50 years old and sometimes get some attitudes at work. A month ago some kid password protected the PC we use to program the robots and PLCs at work - I heard him snickering in the distance ... I asked him to come over (I heard him say to another guy 'see, I knew he'd have to ask). When he came over, his eyes popped - there was the message on the screen 'WARNING - you are about to delete the active partition on your hard drive. All information will be lost. Continue (Y/N)?" I then mentioned I could have gotten real sneaky and attempted ways to get around it, but this was quick and we'd be equals. Got the message across.

This stuff is not helping anyone. Why do you think the amateur ranks are dwindling? When is the last time you actually welcomed someone into a club? Of course, if you keep enough people out of amateur radio, you have more spectrum left to yourself. Which is it we want?

I don't think so. Obsolete is not the question. It is an authorized mode for ham radio. If obsolescence is an issue, then AM, RTTY, SlowScan and many other modes should be removed from the amateur service and the questions dropped. The way technology is going, packet and many of the relatively new modes should be outlawed as well.
The thing that bothers most of us, especially extras, is the cry baby attitude concerning the whole issue from the people who want to work as little as possible to get what others have. I liken this to the welfare mentality I see rampant in society today. If you ever had to work like I and many others did to attain something worthwhile I guess YOU would understand what we feel. Obviously you don't!
Then when all our hard work is thrown out the window, you wonder why people scream? Are you sure your thinking cap is on right?? Or are you so far removed from reality that it doesn't make sense?
Certainly some of the rhetoric on BOTH sides has been absurd, but the anti-code side has been just as whiney. That was my point.
Then the thing that really makes me wonder about the intelligence of some members of our hobby, is if I make even a little stink about this, I'm made out to be some kind of arrogant exclusionist trying to keep everyone else from enjoying ham radio. NOT! I accomplished it, so can anyone else who puts in the effort. Now certainly the lowering of the cw requirement may have been timely, but 5 wpm? only time will tell.
I personally don't think this or even a dropping of cw will save ham radio. This present move by the FCC, will only encourage licensed hams to upgrade. I hardly think hardcore CB'ers are going to flock to our ranks, with the exception of those who will become good op's, maybe some others who disliked cw, but not in droves!
Interestingly enough, I was for the lowering of the cw requirement for general and advanced, maybe even extra to something I felt was more reasonable, 10 wpm maybe. But 5 wpm? As a VE, I had to pass a guy who recorded the dots and dashes onto a paper, then he transposed them to the corresponding words. Everyone in my VE team felt that the rules didn't say that it was wrong, but it sure didn't show any proficiency! I had to pass the guy, I didn't like it though.
As I said, only time will tell what will happen, but I for one think that this move by the FCC will not have the desired effect of growing ham radio, nor do I think that the new upgrades will pollute the extra class bands.

Hi Phil,
If you had the silver plated PL259's you wouldn't have needed to
change out the connectors,unless the SO239's were poorly plated.
To change out the uhf connectors(PL259) on an H.F. rig is
largely a waste of time,effort and money. Don't get me wrong, if
it's your bent go for it. I just don't see the need for it even for
the impedance angle. The PL259's impedance is satisfactory at H.F.,
and a good enough connection to support a couple thousand watts on
SSB. This is provided you have decent connectors to start with.

You pompous jerk! You just admitted that Morse is LESS important than
RTTY, packet, etc., and yet you still defend the old Morse
requirements?! What a hypocrite!

The ONLY one CRYING now is YOU!

And once again, you make a pompous statement like; "The thing that
bothers most of us, especially extras...". HA! I'm sure most Extras
are reasonable people, not part of YOUR vocal PIG-HEAD minority - who
ticked everyone off to the point that the FCC has virtually ELIMINATED
the Morse code requirements.

WHY DON'T YOU JUST SHUT UP, BEFORE YOU GET MORSE CODE REQUIREMENTS
TOTALLY ELIMINATED!!!

I will stick to $325-400.I buy a lot of HF to resell and $500 is more like an e-bay or retail store price.I just picked up a nice TS430S for $325 and these 2 are the same vintage only the 430 is arguably a better radio.I assumed he wanted a great price.

It isnt the place you got it from. Ranger 2950, 2970,2990 and so on have problems with cold solder joints. I had my 2950 sent in to Ranger for repairs and they sent me a new radio saying they couldnt fix mine. Even after getting the new radio hooked up and 2 weeks later it was a different problem. To make a long story short, I fixed mine and found over 30 different cold spots on the pc board and also have fixed 11 of my radio buddies rigs from around here with the same problems. Best thing to do is to fix it and sell it to some new guy and then take your proceeds and spend it on a Uniden HR-2510 or Use the Cobra2000.

In was intrigued to see I think it was Joe under attack for slagging off the FCC. In the USA, Am I right in thinking that your first amendment is all about freedom of speech. Here in the UK that freedom was taken away from us years ago, but being British we just roll over and take it. I mean God forbid any Brit, sorry I mean God help any Brit complaining about the crap that is tipped over us every day. As I have said to you all before USA you dont know how lucky you are.

I don't think you really need to rev the engine to 4000 to shoot skip with a 4 pill , that is unless your charging system is lacking or quite small . Nonetheless, you have once never mentioned your swr, now i am sure your gonna tell me its "perfect man", but how much forward power and how many reflect watts the swr is a major factor when blowing pills you are concerned about the amp which you should be but running at or around the volts you are requires a very good swr especially after you shoot skip all day the pills are quite warm and are looking for a reason to blow

1340. Amp power supply question

Newsgroup: rec.radio.cb
Date: 2000-02-13 00:00:00 UTC
From: Scooter <Scooter@skipland.zzn.com>
Message-ID: <6mEp4.2296$Cx.17227@newsfeed.slurp.net>
Source record: 23959

I have a question regarding powering a 5 pill amp in a mobile. For everyday use it's running at the usual system voltage of 13.8vdc and puts out 700 watts pep. Say I then want to volt it to give near full output. Would using a relay bank to series in a 6 volt battery work? If I were to put 4-40 amp SPDT relays in place I could switch in and out the 6 volt battery. I don't have enough room to mount another alternator, but the alternator I do have is now a 200 amp. I can't juice the rest of the system due to the electronics, but I can safely go to 14.5 volts max. If I were to add in the relays wiring the common to the +12vdc supply line, the normally closed to the +6vdc, and the normally open to the -6vdc. This would provide roughly 18vdc at the amp. I don't think it would overload the alternator, but I know it won't be getting 18 volts of charge. This would only be run this way for short periods of time, and I will install a voltmeter back at the amp input. I'm using a 1100CCA battery now with tons of reserve, and the 6 volt I can get is for the communications industry (CATV line amplifiers and such). I forget the 6 volt rating, but it is fairly high. Will my idea work?

AES is far from a good guideline, however I also think that there is a strong regional variance in radios. I have seen nice 735's go for 350-450, including some with filters, etc., hamfest prices also differ greatly from Internet prices....

I would, however, like to find a nice 430S w/FM for 300-350, quite a nice radio, the quad conversion Icoms are a joy to use as well.

I resent that,I buy so we have an inventory for beginners and others.Its hard to sell HF to some because of the high price myth but if I have something on hand thats another story.I sell for the same price I buy for.Do you want the 430 for $325?

> AES lists the 735 in their used list for $600 and up! Ebay is a poor

AES,Burghardts or any other retail reseller are poor places to shop for used equipment.Not only are thier prices very high but they usually strip the options out of HF rigs and sell them seperatly.
If you want something cheap don't shop,poste an add saying you want a cheap radio in exelent condition.

Greetings!

You know Toll...

You brought up an interesting point.

Since they did not say how it was put together. [Read Semi, Truck, Van
- Dumpster] - we really are "speculating" at what we do, and how we
address, tuning a co-phased antenna.

As a point of observation,

antennas less than 4 feet apart cannot perform well as
a co-phased antenna. The pattern is just not there.

As a secondary note,
The antennas - spaced less than 2 feet apart from each other
need a 50 ohm harness and provide broadbanded response
because these "duals" now form one single unit.

On Sat, 12 Feb 2000 10:28:31 -0600, while the modem was pondering it's
navel, "Toll Free" <tollfree@bigradios.com> dissertated the following:

hi
i have a brand new unopened hewlett packard laserjet 2100 that i will trade
for a rci 2990 base with all the mods.
the printer is worth over $1000.00 canadian plus taxes.
the specs for the printer are:
1200x1200 dpi/10 pages per minuite and 4mb ram.5-8000 pages per toner.
i want to do the trade within canada due to customs regs.
i would also like to know who handles rci radios in canada.
also what is their website url.
if anyone within canada is interested in this trade then let me know.
regards,jeff

Look who the kettle is calling black!! HAHA! You wouldn't know
pompous if it bit you in your butt! I suggest you reread my post after
setting your emotions aside. First off.. how did I admit cw is less
important?? REREAD!!!! I said nothing of the sort!
I am not crying at all, if you had actually read my post, I said I
was in FAVOR of reduced cw requirements, all that bothered me was the
anti-code people saying "stop the whining" when I remember this topic
being all over packet and the newsgroups from years ago with them doing
just as much as the other side! Talk about hypocrites! Also, I am far
from the only vocal person on this side, and not all of them are extras.
Do you actually ever get together with people of differing views and
talk about this rationally?? Judging by your response, I doubt that you
could take the emotion out of it and discuss this in that fashion.
As for cw requirements being eliminated....I doubt anything I say
can change that, or are you going to tattle on me to the FCC and make
them change the rules? OOOOHH...I'm so scared!
I made my own bed? REREAD!!!! I am ready to welcome the new extras!
REREAD!!! I think I made things pretty clear, I have reread my post
several times and bounced it off several friends, all think its pretty
clear where I stand on this and its not too far from your opinion.

Hello Mickey: I am not real familiar with the Bandit 11, but I think
its a copy of a A99, or a look-a-like A99.

In in any case either antenna it will work. These fiberglass antennas
are easy to install, and don't have a lot of wind resistance. I worked
over in England back in the early 90's, and you guys have more than your
fair share of wind!

However the draw backs with these antennas are, interference to local
neighbors electronics, and better performing antennas can be had. Such
as the MaCo V5/8 has 4 ground radials, and I have heard way to many
times that when the A99 type of antennas are replaced with the MaCo V5/8
there is a significant amount of interference reduced or eliminated, and
better antenna performance is seen.

Hello Hans: This type of material is what is studied in collage, and is not a hole lot of use to the outside world, or even asked in job interviews. How about some impedance matching methods for 50 ohns Zo, into a 2 ohm Zo transistor, that is adjustable?

I might have a copy of the Hy-Gain V, let me look.

This is a common problem with 2950's and all the radios with the
big LCD and the 14 buttons. As much as Lou likes to spam the NG,
his ChannelGuard is said to make a substantial improvement to your
receive.

Another problem I have seen if it is in a mobile is location of the coil.. Basically if the coil is not above the roof of the vehicle you can end up sendind large amounts of RF into the vehicle and shocking yourself. Have done this to myself and have seen friends doing it. If everything is grounded out inluding chassis grounds for all your equipment I would try this fix.

Why don't you just pick up the vehicle voltage off of the 12V but series the 12 and 6 together. charge it at 20 volts and just feed the amp off of the 12 and 6 in series. just pick up the vehicle off of the 12v by itself, just make the neg on the 12 you ground.

Source record: 23988

Part I: Discrepancies in Present EM Theory

T. E. Bearden 1982

There are at least twenty-two major discrepancies presently existing in conventional electromagnetics
theory. This paper presents a summary of those flaws, and is a further commentary on my discussion
of scalar longitudinal Tesla waves in a previous paper, "Solutions to Tesla's Secrets and the Soviet
Tesla Weapons," Tesla Book Company, 1981 and 1982.

I particularly wish to express my deep appreciation to two of my friends and colleagues who at this
time, I believe, wish to remain anonymous. One of the two is an experimental genius who can
produce items on the bench that do not work by orthodox theory. The second is a master of
materials science and electromagnetics theory. I thank them both for their exceptional contributions
and stimuli regarding potential shortcomings in present electromagnetics theory, and their
forbearance with the many discussions we have held on this and related subjects.

It goes without saying that any errors in this paper are strictly my own, and not the fault of either of
my distinguished colleagues.

(1) In present electromagnetics theory, charge and charged mass are falsely made identical. Actually,
on a charged particle, the "charge" is the flux of virtual particles on the "bare particle" of observable
mass. The charged particle is thus a "system" of true massless charge coupled to a bare chargeless
mass. The observable "mass" is static, three-dimensional, and totally spatial. "Charge" is dynamic,
four-dimensional or more, virtual and spatiotemporal. Further, the charge and observable mass can
be decoupled, contrary to present theory. Decoupled charge -- that is, the absence of mass -- is
simply what we presently refer to as "vacuum." Vacuum, spacetime, and massless charge are all
identical. Rigorously, we should utilize any of these three as an "ether," as suggested for vacuum by
Einstein himself (see Max Born, Einstein's Theory of Relativity, Revised

Edition, Dover Publications,
New York, 1965, p. 224). And all three of them are identically anenergy -- not energy, but more
fundamental components of energy.

(2) Electrostatic potential is regarded as a purely 3-dimensional spatial stress. Instead, it is the
intensity of a many-dimensional (at least four-dimensional) virtual flux and a stress on all four
dimensions of spacetime. This is easily seen, once one recognizes that spacetime is identically
massless charge. (It is not "filled" with charge; rather, it is charge!) Just as, in a gas under pressure,
the accumulation of additional gas further stresses the gas, the accumulation of charge (spacetime)
stresses charge (spacetime). Further, if freed from its attachment to mass , charge can flow
exclusively in time, exclusively in space, or in any combination of the two. Tesla waves -- which are
scalar waves in pure massless charge flux itself -- thus can exhibit extraordinary characteristics that
ordinary vector waves do not possess. And Tesla waves have extra dimensional degrees of freedom
in which to move, as compared to vector waves. Indeed, one way to visualize a Tesla scalar wave is
to regard it as a pure oscillation of time itself.

(3) Voltage and potential are often confused in the electrostatic case, or at least thought of as
"composed of the same thing." For that reason, voltage is regarded as "potential drop". This also is
not true. Rigorously, the potential is the intensity of the virtual particle flux at a single point -- whether
or not there is any mass at the point -- and both the pressure and the point itself are spatiotemporal
(4-dimensional), not spatial (3-dimensional) as presently assumed. Voltage represents the spatial
intersection of the difference in the potential between two separated spatial points, and always
implies at least a miniscule flow of mass current (that is what makes it spatial!). "Voltage" is spatial
and depends upon the presence of observable mass flow, while scalar electrostatic potential is
spatiotemporal and depends upon the absence of observable mass flow. The two are not even of the
same dimensionality.

(4) The charge of vacuum spacetime is assumed to be zero, when in fact it is a very high value.
Vacuum has no mass, but it has great massless charge and virtual particle charge flux. For proof that

a charged vacuum is the seat of something in motion, see G.M. Graham and D.G. Lahoz,
"Observation of static electromagnetic angular momentum in vacuo," Nature, Vol. 285, 15 .May
1980, pp. 154-155. In fact, vacuum IS charge, identically, and it is also "spacetime" and at least
four-dimensional.

(5) Contrary to its present usage, zero is dimensional and relative in its context. A three-dimensional
spatial hole, for example, exists in time. If we model time as a dimension, then the spatial hole has
one dimension in 4-space. So a spatial absence is a spatiotemporal presence. In the vacuum
4-space, a spatial nothing is still a something. The "virtual" concept and the mathematical concept of
a derivative are simply two present ways of unconsciously addressing this fundamental problem of
the dimensional relativity of zero.

(6) The concepts of "space" and "time" imply that spacetime (vacuum) has been separated into two
parts. We can only think of a space as "continuing to exist in time " To separate vacuum spacetime
into two pieces, an operation is continually required. The operator that accomplishes this splitting
operation is the photon interaction, the interaction of vector electromagnetic energy or waves with
mass. I have already strongly pointed out this effect and presented a "raindrop model" of first-order
physical change itself in my book, The Excalibur Briefing, Strawberry Hill Press, San Francisco,
1980, pp. 128-130.

(7) "Vector magnetic potential" is assumed to be always an aspect of (and connected to) the
magnetic field. In fact it is a separate, fundamental field of nature and it can be entirely disconnected
from the magnetic field. See Richard P. Feynman et al, The Feynman Lectures on Physics,
Addison-Wesley Publishing Co., New York, 1964, Vol. II, pp. 15-8 to 15-14. Curiously, this fact
has been proven for years' yet it has been almost completely ignored in the West. The "Vx"
operator, when applied to the A-field, makes B-field. If the Vx operator is not applied, the "freed"
A-field possesses much-expanded characteristics from those presently allowed in the "bound"
theory. Specifically, it becomes a scalar or "shadow vector" field; it is not a normal vector field.
(note: for V read inverted capital Delta)

(8) The speed of light in vacuum is assumed to be a fundamental constant of nature. Instead it is a function of the intensity of the massless charge flux (that is, of the magnitude of the electrostatic potential) of the vacuum in which it moves. (Indeed, since vacuum and massless charge are one and the same, one may say that the speed of light is a function of the intensity of the spatiotemporal vacuum!). The higher the flux intensity (charge) of the vacuum, the faster the speed of light in it. This is an observed fact and already shown by hardcore measurements. For example, distinct differences actually exist in the speed of light in vacuo, when measured on the surface of the earth as compared to measurements in space away from planetary masses. In a vacuum on the surface of the earth, light moves significantly faster. For a discussion and the statistics, see B. N. Belyaev, "On Random Fluctuations of the Velocity of Light in Vacuum," Soviet Physics Journal, No. 11, Nov. 1980, pp. 37-42 (original in Russian; translation by Plenum Publishing Corporation.) The Russians have used this knowledge for over two decades in their strategic psychotronics (energetics) program; yet hardly a single U.S. scientist is aware of the measured variation of c in vacuo. In fact, most Western scientists simply cannot believe it when it is pointed out to them!

(9) Energy is considered fundamental and equivalent to work. In fact, energy arises from vector processes, and it can be disassembled into more fundamental (anenergy) scalar components, since the vectors can. These scalar components individually can be moved to a distant location without expending work, since one is not moving force vectors. There the scalar components can be joined and reassembled into vectors to provide "free energy" appearing at a distance, with no loss in between the initial and distant points. For proof that a vector field can be replaced by (and considered to be composed of) two scalar fields, see E. T. Whittaker, Proceedings of the London Mathematical Society, Volume 1, 1903, p. 367. By extension, any vector wave can be replaced by two coupled scalar waves.

(10) The classical Poynting vector predicts no longitudinal wave of energy from a time-varying, electrically charged source, In fact, an exact solution of the problem does allow this longitudinal wave. See T. D. Keech and J. F. Corum, "A New Derivation for the Field of a Time-Varying

Charge in Einstein's Theory," International Journal of Theoretical Physics, Vol. 20, No, 1, 1981, pp.
63-68 for the proof.

(11) The present concepts of vector and scalar are severely limited, and do not permit the explicit
consideration of the internal, finer-grained structures of a vector or a scalar. That is, a fundamental
problem exists with the basic assumptions in the vector mathematics itself. The "space'' of a vector
field, for example, does not have inter-nested sublevels (subspaces) containing finer "shadow
vectors" or "virtual vectors," Yet particle physics has already discovered that electrical reality is built
that way. Thus one should actually use a "hypernumber" theory after the manner of Charles Musï¿½s.
A scalar is filled with (and composed of) nested levels of other "spaces'' containing vectors, where
these sum to "zero" in the ordinary observable frame without an observable vector resultant. In
Musï¿½s' mathematics, for example, zero has real roots. Real physical devices can be -- and have
been -constructed in accordance with Muses' theory. For an introduction to Musï¿½s' profound
hypernumbers approach, see Charles Musï¿½s' foreword to Jerome Rothstein, Communication
Organization and Science, The Falcon's Wing Press, Indian Hills, Colorado, 1958. See also Charles
Musï¿½s, "Applied Hypernumbers: Computational Concepts," Applied Mathematics and
Computation, Vol. 3, 1976. See also Charles Musï¿½s, "Hypernumbers II," Applied Mathematics and
Computation, January 1978.

(12) With the expanded Tesla electromagnetics, a new conservation of energy law is required. Let
us recapitulate for a moment. The oldest law called for the conservation of mass. The present law
calls for the conservation of "mass and energy", but not each separately. If mass is regarded as
simply another aspect of energy, then the present law calls for the conservation of energy. However,
this assumes that energy is a basic, fundamental concept. Since the energy concept is tied to work
and the movement of vector forces, it implicitly assumes "vector movement" to be a "most
fundamental" and irreducible concept. But as we pointed out, Whittaker showed that vectors can
always be further broken down into more fundamental coupled scalar components. Further, Tesla
discovered that these "coupled components" of "energy" can be

individually separated, transmitted,
processed, rejoined, etc. This directly implies that energy per se need
not be conserved. The new
law therefore calls for the conservation of anenergy, the components of
energy. These components
may be coupled into energy, and the energy may be further compacted into
mass. It is the sum total
of the (anenergy) components -- coupled and uncoupled -- that is
conserved, not the matter or the
energy per se. Further, this conservation of anenergy is not spatial;
rather, it is spatiotemporal in a
spacetime of at least four or more dimensions.

(13) Relativity is presently regarded as a theory or statement about
fundamental physical reality. In
fact, it is only~ a statement about FIRST ORDER reality -- the reality
that emerges from the vector
interaction of electromagnetic energy with matter. When we break down
the vectors into scalars
(shadow vectors or hypervectors), we immediately enter a vastly
different, far more fundamental
reality. In this reality superluminal velocity, multiple universes,
travel back and forth in time, higher
dimensions, variation of all "fundamental constants" of nature,
materialization and dematerialization,
and violation of the "conservation of energy" are all involved. Even our
present Aristotlean logic --
fitted to the photon interaction by vector light as the fundamental
observation mechanism -- is
incapable of describing or modeling this more fundamental reality. Using
scalar waves and scalar
interactions as much subtler, far less limited observation/detection
mechanisms, we must have a new
"superrelativity" to describe the expanded electromagnetic reality
uncovered by Nikola Tesla.

(14) "Charge" is assumed to be quantized, in addition to always
occurring with -- and locked to --
mass. Indeed, charge is not necessarily quantized just as it is not
necessarily locked to mass.
Ehrenhaft discovered and reported fractional charges for years, in the
30's and 40's, and was
ignored. See P.A.11. Dirac, "Development of the Physicist's Conception
of Nature," Symposium on
the Development of the Physicist's Conception of Nature, ed. Jagdish
Merha, D. Reidel, Boston,
1973, pp. 12-14 for a presentation of some of Ehrenhaft's results.
Within the last few years Stanford
Universityï¿½ researchers also have positively demonstrated the existence
of "fractional charge." For a
layman's description of their work, see "A Spector Haunting Physics,"

Science News, Vol. 119,
January 31, 1981, pp. 68-69. Indeed, Dirac in his referenced article points out that Millikan himself
-- in his original oildrop experiments -- reported one measurement of fractional charge, but
discounted it as probably due to error.

(15) Presently, things are always regarded as traveling through normal space. Thus we use or model
only the most elementary type of motion -- that performed by vector electromagnetic energy. We do
not allow for things to "travel inside the vector flow itself." Yet, actually, there is a second, more
subtle flow inside the first, and a third, even more subtle flow inside the second, and so on. We may
operate inside, onto, into, and out of energy itself -- and any anenergy component of energy. There
are hypervectors and hyperscalars unlimited, within the ordinary vectors and scalars we already
know. Further, these "internal flows" can be engineered and utilized, allowing physical reality itself to
be directly engineered, almost without limits.

(16) We always assume everything exists in time. Actually, nothing presently measured exists in time,
because the physical detection/measurement process of our present instruments destroys time,
ripping it off and tossing it away -- and thereby "collapsing the wave function." Present scientific
methodology thus is seriously flawed. It does not yield fundamental (spacetime) truth, but only a
partial (spatial) truth. This in turn leads to great scientific oversights. For example, mass does not
exist in time, but mass x time (masstime) does. A fundamental constant does not exist in time, but the
"constant x time" does. Energy does not exist in time, but energy x time (action) does. Even space
itself does not exist in time -- spacetime does. We are almost always one dimension short in every
observable we model. Yet we persist in thinking spatially, and we have developed 1nstruments that
detect and measure spatially only. Such instruments can never measure and detect the
phenomenology of the nested substrata of time. By using scalar technology, however, less limited
instruments can indeed be constructed -and they have been. With such new instruments, the
phenomenology of the new electromagnetics can be explored and an engineering technology
developed.

(17) We do not recognize the connection between nested levels of virtual state (particle physics) and
orthogonally rotated frames (hyperspaces). Actually the two are identical, as I showed in the
appendix to my book, The Excalibur Briefing, Strawberry Hill Press, San Francisco, 1980, pp.
233-235. A virtual particle in the laboratory frame is an observable particle in a hyperspatial frame
rotated more than one orthogonal turn away. This of course implies that the hyperspatial velocity of
all virtual particles is greater than the speed of light. The particle physicist is already deeply involved
in hyperspaces and hyperspatial charge fluxes without realizing it. In other words, he is using
tachyons (particles that move faster than light) without realizing it.

(18) Presently quantum mechanics rigorously states that time is not an observable, and therefore it
cannot be measured or detected. According to this assumption, one must always infer time from
spatial measurements, because all detections and measurements are spatial. With this assumption,
our scientists prejudice themselves against even looking for finer, subquantal measurement
methodologies and instrumentation. Actually this present limitation is a result of the type of
electromagnetics we presently know, where all instruments (the "measurers") have been interacted
with by vector electromagnetic energy (light). Every mass that has temperature (and all masses do!)
is continually absorbing and emitting photons, and in the process they are continually connecting to
time and disconnecting from time. If time is continually being carried away from the detector itself by
its emitted photons, then the detector cannot hold and "detect" that which it has just lost. With Tesla
electromagnetics, however, the fundamental limitation of our present instruments need not apply.
With finer instruments, we can show there are an infinite number of levels to "time", and it is only the
"quantum level time" which is continually being lost by vector light (photon) interaction. By using
subquantal scalar waves, instruments can move to deeper levels of time -- in which case the upper
levels of time ARE measureable and detectable, in contradistinction to the present assumptions.

(19) In the present physics, time is modeled as, and considered to be, a continuous dimension such
as length. This is only a gross approximation. Indeed, time is not like continuous "dimension," but
more like a series of "stitches," each of which is individually made and

then ripped out before the
next stitch appears. "Vector light" photons interact one at a time, and
it is this interaction with mass
that creates quantum change itself. The absorption of a photon -- which
is energy x time -- by a
spatial mass converts it to masstime: the time was added by the photon.
The emission of a photon
tears away the time, leaving behind again a spatial mass. It is not
accidental, then, that time flows at
the speed of light, for it is light which contains and carries time. It
is also not accidental that the
photon IS the individual quantum. Since all our instruments presently
are continually absorbing and
emitting photons, they are all "quantized," and they accordingly
"quantize" their detections. This is
true because all detection is totally internal to the detector, and the
instruments detect only their own
internal changes. Since these detections are on a totally granular
quantized background, the
detections themselves are quantized. The Minkowski model is
fundamentally erroneous in its
modeling of time, and for that reason relativity and quantum mechanics
continue to resist all attempts
to successfully combine them, quantum field theory notwithstanding.

(20) Presently, gravitational field and electrical field are considered
mutually exclusive. Actually this is
also untrue. In 1974, for example, Santilly proved that electrical field
and gravitational field indeed
are not mutually exclusive In that case, one is left with two
possibilities: (a) they are totally the same
thing, or (b) they are partially the same thing. For the proof, see R.
M. Santilli, "Partons and
Gravitation: Some Puzzling Questions," Annals of Physics, Vol. 83, No.
1, March 1974. With the
new Tesla electromagnetics, pure scalar waves in time itself can be
produced electrically, and
electrostatics (when the charge has been separated from the mass)
becomes a "magic" tool capable
of directly affecting and altering anything that exists in
time--including gravitational field. Antigravity
and the inertial drive are immediate and direct consequences of the new
electromagnetics.

(21) Presently, mind is considered metaphysical, not a part of physics,
an not affected by physical
means. Literally, the prevailing belief of Western scientists is that
man is a mechanical robot -- even
though relativity depends entirely upon the idea of the "observer."
Western science today thus has
essentially become dogmatic, and in this respect borders on a religion.

Since this "religion," so to speak, is now fairly well entrenched in its power in the state, Western science is turning itself into an oligarchy. But mind occupies time, and when we measure and affect time we can directly measure and affect mind itself. In the new electromagnetics, then, man regains his dignity and his humanity by restoring the reality of mind and thought to science. In my book, The Excalibur Briefing, I have already pointed out the reality of mind and a simplified way in which it can be modeled to the first order. With scalar wave instruments, the reality of mind and thought can be measured in the laboratory, and parapsychology becomes a working, engineering, scientific discipline.

(22) Multiple-valued basic dimensional functions are either not permitted or severely discouraged in the present theory For one thing, integrals of multiple valued derivative functions have the annoying habit of "blowing up" and yielding erroneous answers, or none at all. And we certainly do not allow multiple types of time! This leads to the absurdity of the present interpretation of relativity which permits only a single observer (and a single observation) at a time. So if one believes as "absurd" a thing as the fact that more than one person can observe an apple at the same time, the present physics fails. However, the acceptance of such a simple proposition as multiple simultaneous observation leads to a physics so bizarre and incredible that most Western physicists have been unable to tolerate it, much less examine its consequences. In the physics that emerges from multiple simultaneous observation, all possibilities are real and physical. There are an infinite number of worlds, orthogonal to one another, and each world is continually splitting into additional such "worlds" at a stupendous rate. Nonetheless, this physics was worked out by Everett for his doctoral thesis in 1956, and the thesis was published in 1957. (See Hugh Everett, III, The Many-Worlds Interpretation of Quantum Mechanics: A Fundamental Exposition, with papers by J. A. Wheeler, B.S. DeWitt, L. N. Cooper and D. Van Vechten, and N. Graham; eds. Bryce S. Dewitt and Neill Graham, Princeton Series in Physics, Princeton University Press, 1973.) Even though it is bizarre, Everett's physics is entirely consistent with all the present experimental basis of physics. The present

electromagnetic theory is constructed for only a single "world" or universe -- or "level." The
expanded theory, on the other hand, contains multiply nested levels of virtual state charge -- and
these levels are identically the same as orthogonal universes, or "hyperframes." Multiple kinds -- and
values -of time also exist. The new concept differs from Everett's, however, in that the orthogonal
universes intercommunicate in the virtual state. That is, an observable in one universe is always a
virtual quantity in each of the other universes. Thus one can have multi-level "continuities" and
"discontinuities" simultaneously, without logical conflict. It is precisely these levels of charge -- these
levels of scalar vacuum -- that lace together the discontinuous quanta generated by the interaction of
vector light with mass.

However, to understand the new electromagnetic reality, one requires a new, expanded logic which
contains the old Aristotlean logic as a subset. I have already pointed out the new logic in my paper,
"A Conditional Criterion for Identity, Leading to a Fourth Law of Logic," 1979, available from the
National Technical Information Center, AD-A071032.

Even as logic is extended, quantum mechanics, quantum electrodynamics, and relativity are
drastically changed by the Tesla electromagnetics, as I pointed out in my paper, "Solutions to Tesla's
Secrets and the Soviet Tesla Weapons," Tesla Book Company, 1580 Magnolia, Millbrae,
California, 94030, 1980.

The present electromagnetics is just a special case of a much more fundamental electromagnetics
discovered by Nikola Tesla, just as Newtonian physics is a special case of relativistic physics. But in
the electromagnetics case, the differences between the old and the new are far more drastic and
profound.

1, Boren, Dr. Lawrence Milton, "Discovery of the Fundamental Magnetic Charge (Arising from the
new Conservation of Magnetic Energy)," 1981/82 (private communication). Dr. Boren has a cogent
argument that the positron is the fundamental unit of magnetic charge. His theory thus assigns
fundamentally different natures to positive charge and negative charge. In support of Dr. Boren, one

should point out that the "positive" end of circuits can simply be "less negative" than the "negative"
end. In other words, the circuit works simply from higher accumulation of negative charges (the
"negative" end) to a lesser accumulation of negative charges (the "positive" end). Nowhere need
there be positive charges (protons, positrons, etc.) to make the circuit work. Dr. Boren's theory,
though dramatic at first encounter, nonetheless bears close and meticulous examination -- particularly
since he has been able to gather experimental data which support his theory and disagree with
present theory.

Are you sending to another radio nside your house?
Being too close will overmodulate and sound screwy.
I don't think they need tuning from just sitting in a closet, unless there is an ogre living there.

You got me there Jay!
I would like to know also how to do the Z matching.
I just posted that stuff, because about half a year back I had quite an interesting debate with some youngster just out of school who knew too much.
Maxwell came up, and proof was wanted, so I finally found some and sent it.

The point was that so much theory is based on what they teach in college.
I went to E. engineering and flunked after two years.
So this shows that a lot of what they teach is just plain wrong, or at least incomplete.
I'll leave it at this, and talk about CB.
Thanks very much for your response, and especially if you do find a diagram.

Yes. However, it is mis-understood. No one takes time to read it before using it as ammunition to say anything they wish.

>
> Yes you are most correct that the government
> has restricted free speech to some extent.

You've only hit the tip of the iceberg, James. Restrictions on free speech are extremely widespread in this country.

Almost any speech advocating civil rights for whites is considered "hate speech," and widely banned by media and/or government. If white civil rights advocates are shown on national media, it is often paid actors who are only acting like civil rights advocates (and who make comments that no real person would ever advocate).

Military personnel are being discharged for past political comments made or current political affiliations (especially those on the right of the political spectrum). Affirmative action is totally out of control in the military (blacks are getting promoted ten times faster than whites - black women outnumber white women five to one in the ranks above E-5), and any objection by whites is widely censored.

Even cigarette smokers (not the tobacco industry - smokers) are banned from appearing on national media to defend themselves from attacks by anti-smokers (how do you think the lawsuits were won, or high taxes on cigarettes were created, without objection from smokers).

I grew up as a liberal with a real fear of big brother and government control. It turns out the the liberal is far more dangerious than

anything I ever imagined about big brother. Liberals, under the leadership of Bill Clinton, have done more to destroy the Constitution than any dictator could ever do.

And conservatives should not be patting themselves on the back right now. The Republican Party has been playing right along with the Democrats, and they most certainly have not done a thing in defense of free speech.

: Then when all our hard work is thrown out the window, you wonder why
: people scream? Are you sure your thinking cap is on right?? Or are you
: so far removed from reality that it doesn't make sense?

Why was all your "hard work thrown out the window"? You still can copy
and send 20+ wpm on CW - I hope. Many extras cannot do that any more, as
many of them have seldom been on CW since they got their rating.

Just get on the CW segments and USE your ability to send and receive that
fast. If the people with a lower speed capability want to talk to you,
they will get their code speed up. If not, then you can gloat and brag
about being better than the other extras who cannot keep up.

Just don't try to communicate with some who can copy much faster than
you can - they just might make fun of you in return.

: Certainly some of the rhetoric on BOTH sides has been absurd, but
: the anti-code side has been just as whiney. That was my point.
: Then the thing that really makes me wonder about the intelligence of
: some members of our hobby, is if I make even a little stink about this,
: I'm made out to be some kind of arrogant exclusionist trying to keep
: everyone else from enjoying ham radio. NOT! I accomplished it, so can
: anyone else who puts in the effort. Now certainly the lowering of the cw
: requirement may have been timely, but 5 wpm? only time will tell.

I was in favor of 10 wpm myself. That is just about where one of the
common plateaus occurs.

: the more I think maybe there's not that big of a difference. I know I'm
: going to take a lot of flak for this, but you need to grow up.

There isn't a lot of difference. There are whiners/moaners in both groups - just as there are those that enjoy either or both of the hobbies to the fullest extent possible.

In general, there is less jamming etc on the Ham bands, but that is because the Hams tend to police their frequencies better - and the FCC has been a BIT more responsive in shutting down the troublemakers.

It is always going to be impossible to satisfy everyone. We must also keep in mind that technology has changed drastically in the last 50 years or so. Hams no longer build the transmitter/receiver that they use frequently. Most equipment is purchased, as the receivers have just become too complicated to design and build yourself - if you want all the capabilities that exist in modern rigs. It also saves you little or no money over just buying the commercial gear - which was one of the reasons to build your own gear in the first place.

Always check it with a bird, it is very common to see some of the amps that will show you a large amount of reflect with it on and none with it off. Some people tend to keep cranking on a trimmer till they see more output, not knowing what they are trully seeing. A 43 will show your reflect at any wattage, a dosy goes to shit when checking SWR at higher wattages.

Even if I pick up on the 12v for the car since it's charging at 20 volts
it'll probably be more than 15 volts. That's too much from what I was told.
I asked a tech about the electronics in the car and he said that they'd only
be able to withstand 14.5, and small surges to 15 or slightly more. If I
have to put the 6 volt on a charger everytime I use it that will be ok.
It's a deep cycle battery, and I won't be using it all of the time. Even
while using it it should still be able to draw enough of a charge to keep it
topped off.

1398. Re: won't unkey

Newsgroup: rec.radio.cb
Date: 2000-02-14 00:00:00 UTC
From: Rob <cutfeline@hotmail.com>
Message-ID: <888ci5$i15$1@news1.mpx.com.au>
Source record: 24109

If it is on high power only, here is my suggestions...
(1) Run on lower power.
(2) THEORY ONLY! The output is being rectified somewhere on the tx line. Try operating the radio further away from the antenna.
(3) Try a small capacitor as an RF bypass in the microphone.. for that matter, try another microphone.
(4) Perhaps your high power is affecting the TX diode. Perhaps if you earth the case of your radio, it might help (this is a long shot, but easy)

Mark <mrustad@wctc.net> wrote in message news:WmJp4.297$q2.12310452@news.wctc.net...
> I have a cobra 29 ltd classic that I bought used. I think it puts out about 10 watts. when I run my dx350 amp with it, it won't unkey using high but it does on the other powers. the swrs are about 1.5 or less. anybody know how to make this work right?

I agree with PEAKABOO. Check the SWR between the radio and the amp with the radio on high and the amp on. I'm willing to bet the SWR will be much higher. You also said "I think it puts out about 10 watts." This is the time to have a meter in line all the time. It is very important to know what's going in and what's going out.

Joe, this is sad and in very poor taste. Is this really what you want
to do with your life?

I'll courtesy copy this reply to the Dayton Hamvention points of
contact as well as many, many other hamfest points of contact on the
ARRL website. I only ask that they discourage this sort of behavior and
obnoxious display at their events. I'm sure that I can find better use
for my time and -money- than to attend an event where I am openly
offended by my peers. I wonder if I am alone in thinking this?

Please reconsider your offer.

73,
Brian/N0iMD

A friend of mine told me my RCI 2950 only dead keys (i.e. no audio) when I tried to talk with him. This rig has had all the mods done to it. Does anyone know of a mod that would have caused this or is there something else that needs to be done to make it work in CB range?? The radio will display the CB channels and everything when the right buttons are pressed.. It's hard troubleshooting up here cause not many people use CB. Just want to make sure it works before I head to the lower 48 this summer.

Galaxy 99 has served me very well, dated technology but proven as pretty durable, many of the new breed of microprocessed scanning LCD display rigs can have a series of small but annoying problems(backlights out, really cheap switches as in the eagle clones line, and very cheap production methods) that add up to a pain. The echo and other crap on the 99 is sort of useless for sideband use, but I will go so far as to say that even the most dedicated SSB'er has turned on the echo and beep and gone down to 19 for an "okie-dokie" session when they are travelling...sort of like doin' a fat chick, it's ok as long as you don't run into any of your friends at the bar.

Damn hard to beat the old 2510 for reliability but no bells and whistles or even memories, tough radio that can and hashad everything under the sun tried on it for mods...

Al, you really need to get on the band wagon. All that has transpired concerning the ham bands has been the 'addition' of HF spectrum and the 'elimination' of some VHF and SHF spectrum. Who operates on the HF and who operates to help keep our VHF and SHF frequencies?

I am seeking 1950s and 1960s Raytheon CB radio equipment for my personal collection. I have TWR-2, TWR-5, and TWR-7; looking for all other models. I prefer sets that are cosmetically nice and either working or reparable. Will consider parts rigs and "fixer-uppers". Also want owner's manuals, service manuals, magazine and catalog ads, product reviews, etc, anything having to do with Raytheon CB gear. Need crystals, too, especially the larger holders.

I hope to build a decent collection of radios and also literature, then put together a web site. Along those lines, do you have any Raytheon gear in your collection that you can photograph for me? I'll post pics of your radios until I get my own.

Not interested in marine or commercial radios.

No. Since the product labelled as Palomar is generally illegal to manufacture and sell, they would be pressing their luck to put up a web site and attract the attention of the authorities. Try checking at your local truck stop.

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 35.00 plus shipping.

A Picture can be e-mailed.

HAHAHA! Why should I complain, you've proven my point for me perfectly! All I ever said, and if you had ever really read my posts you would have seen it for yourself, was that there has been quite a bit of childishness and whining from both sides of this issue! It has been a constant flood of illogical statements, derogatory comments and down right foul language from every point of view. Non of this proves either side was right, just showed how immature some people are.
I have sat down many times with friends and strangers over coffee or a beer and had a great time discussing these issues with them. Very few times have we all agreed, but we had mature discussions and actually heard each others opinions and came away with a better understanding of the other side and respected them for it.
I have been in favor of reducing the cw requirements for some time now. Need I say it again, or can't you understand plain english? We are on the same side! I just felt that for the anti-code side to tell others to stop whining after a couple of decades of the same was hypocritical. I do understand the feelings of extras who have worked hard to get cw speeds up to pass the exams, only to see that work discarded. I still believe that cw's importance has lessened over the years and the exams should reflect that.
I will offer you this, if you are ever in the Rochester, NY area, I would like to meet you and discuss this over coffee or whatever, your choice, I'll buy, lets carry on a real dialogue and just have fun!

I have lost a step with age. I used to dunk it with two hands from a standing-still flat foot position. Now I need a running start and use only one hand. I've got extremely long arms, like my orangutan cousins. Put $600 of knee braces on me and I can still do it. After all, I only have to get the ball about one foot higher than just standing and holding it. And being able to palm the ball one-handed sure helps.

I'm trying to communicate with someone about 15 miles away over a hill. They are in a valley and I am just below the top of the hill. I am getting them at 4 pound radio 4 but they can't hear me at all even though when I mike in their needle shoots up to 4 pound. They are using a power mike and I am not so someone suggested that I don't have enough mod. Has anyone got any other ideas or tips?

Matt.

I'm using a Antron 99 on a 20ft pole and a Danita 1240.

> clear where I stand on this and its not too far from your opinion.

It seems I shut out listening to you when you trotted out the old "crybaby" term. It is kind of funny because you may be MORE inclined to lower CW requirements than me.

Anyway, it seems that our argument has distilled down to be over the importance of Morse. Here too, I have stopped listening to arguments from the other side. There may BE some use for Morse - but the UNREASONABLE attitude in the past pissed off so many people that I can see why they acted unreasonable, and lowered the requirement to 5wpm. IT WAS PUNISHMENT. Now the other side is "crying". And it just feels SO GOOD to rub their own words in their face.

Maybe one day we can get back to talking to each other, instead of screaming at each other.

Oh, by the way, it seems you don't like me editing previous posts; well, my newsreader doesn't let me include too much old text in replies. I think it is an etiquette thing.

I had this problem with a 2990 and it was a bad solder joint on the main board along the edge near the center of the radio where the board meets the metal chassis. Take the bottom cover off and when the radio is doing this apply slight pressure along the edge of the board and if this is your problem it will show up.

Joe doesn't seem to HAVE a life, or it wouldn't have been destroyed by
restructuring.

When I joined the state credit union years ago.. you had to be employed by a state agency to become a member, I met the qualifications at the time, no comlpaints.

Two years ago.. the credit union decided to open its doors to everyone. Lo and Behold! there were tons of people joining.

Should I complain that these people didn't have to "qualify" the same way I did?

Maybe these people aren't as smart as me...

Maybe their money is different from mine...

Maybe this is all a big WASTE OF MY TIME!

Good Greif.

This whole babble on restructing is still going on? I guess there are those that will never accept change. Good or bad it is here and it is here to stay.

One more comment. If the reactions about this are bad just wait for about ten more years. Sometime in 2001 or later the ITU will take up the issue of removing the code requirement period. Boy will that start a cry that will make this look like a whimper. Get ready it willl happen.

regards
james

And for those that seem to think that the extra class license has been cheapened, I pose this.

The ITU has never placed a minimum speed requirement or a maximum speed requirement on code. The treaty has only stated that code is a requirement for operation in the amatuer bands operating below 30 MHz. What is an acceptable level has been for most part a determination of the resisdent countries signees of the treaty. The US implemented requirements for incentive based licensing. It known that in the last 20 years the incentive to become an extra class license has deminished. The priviledges gained have not been significant to warrant the effort. In an incentive based licensing system if no one is willing to reach the top level then maybe the carrot is unobtainable or the rewards for obtaining the carrot are not sufficient.

In my opinion the rewards for obtaing the carrot no longer seem reasonable. With that the extra class portions of the bands have in most part been the least used of the spectrum below 30 MHz. The extra class licensee of the past have enjoyed less crowded segments and are quite happy of that. Most of the arguements about restructing have only centered arround the main fact that the extra class segment now will become more crowded and this really pisses many off. They feel cheated and that the license class they so proudly hold have been cheapened. This, from their perspective, is true. It seems that work like Joe is doing is to distinguish between older extra class and newer extra class. It appears to me that this is some move to segrate those before and those after. To me this in its own right smacks of prejudice. These people that want to distinguish between pre 4/15/2000 extra class licnesees from those who accomplish the feat after, are in fact very poor examples of what members of amatuer radio should be. This attitude is deplorable and should not be allowed in amatuer radio. If this new restructuring is so offensive, may I suggest that you not renew your license when the time comes. I think the amatuer community will be better off without the like of those that will hold prejudices against the new extra class licneses that will follow after 4/15/2000.

The Supreme Court has ruled that all speech is not protected under the
Constitution. For example, to yell fire in a crowded room to start a panic is
not considered free speech. There are limitations that protect the masses from
harmful speech. In cases where one speaks out against the government, that will
get the attention of the FBI and will get you monitored quickly. If speech
becomes threats to the safety of the masses and the government it has been also
deemed as not protected under the Constitution.

Also speech intended as malice and/or intended to defame one's character is also
not considered free speech.

Yes you are most correct that the government has restricted free speech to some
extent.

Good advice, it is very doubtful that the same thing is wrong with both radios. Try them on-the-air before you decide if they are bad. Talk with someone at a distance. A mile away should be safe. Also if you are testing these with a bench power supply that can not supply enough current you will have these symptoms. In other words" Since both radios have the same problem it probably is not the radios". Look at antenna, power supply, proximity to the test radio. Post what you find out.

Brian,

Just remember, it's not illegal (yet!) to be an ass... If someone
chooses to act this way, fine.

Please excuse the language in the following, but it DOES make
a difference to how this is presented.

A friend (an extra I think... You know, it doesn't matter. I don't
believe his license class EVER came up in discussion, and I
never checked!) explained to me to 'calm down' once. He
told me there are allways assholes. And that these kinds of
people attract other assholes. You have to think of them as
'asshole magnets'. Only here likes attract, not repel. And if you
let yourself be attracted to them, even to disagree, you're just
another asshole.

Mike

Source record: 24074

Not too bad of a radio, one really annoying problem is that if DC voltage is interrupted (turn off the car key) it reverts to a default frequency/band/mode and the 11m must be enabled manually by a combination of switchpad entries to get it back. Strange that no one has posted a mod to supply backup memory power....where are all of the techs????
Construction no where near as rugged as, say, the 2510, but generally good audio reports and decent rec'v. in a relatively quiet environment

I am trying to figure out my antenna arrangement for the roof of my Tahoe. I want a short antenna on an NMO mount but can't find any. I realize that the short antennas are not as efficient but there are trees over the driveway that I do not want to cut.

Has anyone tried the Designer Series by Firestik?

Does anyone know of a short antenna (about 2 feet) on an NMO mount? or any other "good" short antennas for roof mounting?

Thanks for any ideas.

Hutch

There is no such thing as a good short CB antenna. The two words are
mutually exclusive. I have a KW-3 I put on when I have to use a
parking garage. There is no comparison to a KW-7. The 3 foot sux!

Has anyone else noticed a rapid decline to the sh*t pile on 27.555? In all of two weeks it has gone from a great int'l contact channel to a bunch of crybaby's and whiners. Today I listened to someone making endless Star Trek sounds combined with echo while anyone was trying to make contact. Numerous others were bickering and crying trying to say that they run the channel. I think it was yesterday I heard someone bitching that they could do what they want on that channel, and that unless it could be proven that it was an int'l calling channel he'd do what he wanted on it. Is this the way it's going to be now, or is this just another phase? I haven't been using it too long so maybe things like this happen in cycles. I thought that SSB was supposed to be between the stereotyped CBers and the Hams. Curteuos and helpful, not rude and flat out ignorant. I know I'm going to get flamed for this, and I'll probably hear "If you don't like it stay off of the channel." As it is I have been staying off of the channel because of this. You can't get anything accomplished with 30 people screaming at each other and making tons of noise. I realise a gentleman's agreement isn't a law, or even a rule, but usually it's acknowledged. There are tons of other channels out there to cause mayhem on, I guess it's just easier to pick a quiet channel where people are pushing the airwaves, and the theory to make contacts under weird conditions. I just felt I had to vent, sorry to waste your time.

I Saw something VERY interesting on VH-1's "where are they now?" show.

Sir Mix-A-Lot is a Cb'er!

(remember? He's the rapper that had the rap song... "Baby got back")

Now the way the show put it.. He was into fixing "Ham Radios"

Although the pictures and he showed a different picture. I saw a Cobra 2000, a Galaxy Saturn, and a BIG amp to his left!

The Cobra was sitting on what else? Channel 6!

The way I knew there I amp being used, I heard the loud relay, CLONK! when he unkeyed! LOL

Anyone talk to Sir Mix-A-Lot on the Superbowl?

I just thought it was very funny! LOL

You will need a device known as an "antenna". Without an "antenna", you
will have very poor results.

Source record: 24098

Its alot of radio for the money...the audio is loud and clean from all reports i have had on several different radio checks and test recordings of the radios transmissions. The only problem i have had with mine is that the front display lighting is burned out on one side...however it has not affected the transmit or receive audio quality. I have talked to two other people via skip who told me their radios had the same problem, but seemed bullet proof otherwise.

Mine has a dead carrier of 4.25 watts...and swings to about 20 watts or so (RF Limited power mic that is powered by the radio itself...yea, no batteries!) with good bass responce...does 11 watts carrier on FM (FM don't swing much) and over 22 watts on SSB with crystal clear modulation that is in your face & loud!!

I talked to one old cat up in the hills somewhere several states and about 2000 miles away who was on a Galaxy Saturn, and get this...we were on FM!!! He told me i had one of the clearest transmissions he had ever heard. When i found out he had FM capability...and asked him to switch over...he said it never occured to him to talk skip on FM before, that he had never heard of it before. It was great!! Back to the point...these are great radios for $130. Even with the burned out display light....i feel i got an outstanding deal. You can also get the same radio under the brand names of Titan & Dragon. And in case your curious...i have had Ranger 2970, Mirage 2950, President Lincoln and Galaxy DX 2527 radios, all new, so i know what a good radio is. If you can get a new radio that is all mode capable...has 400 channels and sounds decent, for $130, do it. So long.

Poor behaviour noted. Fortunately we don't get to much of that in 43
division unless the conditions are really wide open and we get either the
states or europe thundering in. However when we do there are other freq's
to go to - from memory there are heaps of other "freebander" channels
available - particularly beneath the 40. I cannot remember what they are
but have a listen around - in any event this probably wouldn't be a good
forum to give out the freq's for these channels as some of the idiots you
have mentioned are bound to be on this NG.

Welcome to the wonderful world of 11m. for the most part it was bound to happen. I have been on 11m since the mid 70s. With the wide spread use of amps on the reg.40 came a bunch of very irresponsible operators. even know those who were acting the fool were the minority they were a vocal minority. I remember this same type of thing happening to my old stand by freq 27.255 ch23. There was a bunch of us out there for years. Then a few new comers thought that all the radio was or was to interrupt others communications. So we disbanded from ch 23 and went down to 26.905. This was home for almost ten years. Then the same thing happened there. But this time in the form of some pulse noise that has been known to continue for 30 minutes or better at a time. so now I have been going back to the old triple nickel. I have heard the stuff you speak of and it is stupid. But I think that the best way to deal with all of the bs is to ignore it. They are immature children in adult bodies that think that the only way to gain attention is to be disruptive. A child just wants somebody to acknowledge that they are alive, negatively or elsewise. Let it go forget them and besides there are alot of other uppers with lots of great people on them. Do not let a few fools rain on your picnic, for the majority of freebanders are fine operators

yea right, The so called ham service is less used and in poorer repair than 11m ever could be. You have a choice either the immaturity of the 11m or the ego monsters of the ham. Case in point, all the extras whining and crying about the restucture and what the fcc as done to them. Rather than that I thought all of us hams were out for the good of the service. Some growing up on both sides is needed. I sure would hate the newcomer to belive that all is ok when you get that ticket. But them again if you ever run out of toilet paper...

Is this the best arguement you can do? No wonder CW is dead
and rapidly disappearing! And lame arguements like this
just boost the cynicism levels of those who are already
laughing at this.

This BS whiney argument that CW is some kind of magical
cure-all mode that will save HAM radio, cure herpes, and make
your dog stop eating tidbits from the cat litter box really has to
stop.

BULL$#!+!!

CW is fun, nothing more, nothing less. It's neat to operate, and
can be accomplished with a minimum of effect IF the skills are
there. But what I DO object to is mandatory skill sets that really
have no relevance to being a competant quality operator.

I like to camp, and I have fairly good skill set there. But I see no
reason why every single parent that goes on an occasional
campout with their kids Boy Scout troop has to be a Daniel Boone
and be fully skilled.

Mike

1487. D&J Electronics ECHO Repeater question!!!

Newsgroup: rec.radio.cb
Date: 2000-02-16 00:00:00 UTC
From: oneqck76ta@aol.com
Message-ID: <20000216105255.05400.00001560@ng-cf1.aol.com>
Source record: 24156

Hello all, I have a question. I just recived a D&J Electronics ECHO Repeater (Model #EC-20D S/N #8996. That is what is on the box) and it has a 5 Pin Din plug on it for the mic and the radio. Would anyone know what the wiring is so I can rewire it to a 5 pin for my Cobra 148gtl? Also, I have the address for D&J Electrics but no phone number. Does anyone know if they are still around? The original sales slip for this thing is from feb. 1985 and it was used for 3 months in my uncles semi so I know it works. Can't remeber what radio he had though. Any help would be great. Thanks in advance.

73's all.

I have. For the ones that didn't already know, the "Cobra" amps are not made by Cobra Electronics. It is simply another underground company making money off the Cobra name; kinda like the Galaxy Saturn thing. Everyone knows that Galaxy does not make the Saturn model as well as a few other ones.

"" kinda like the Galaxy Saturn thing. Everyone knows that Galaxy does not make the Saturn model as well as a few other ones....."

Actually, "GALAXY" dosen't "make" anything. All of these radios (Saturn, DX-2527 etc) are made by Ranger Communications in the orient. The "people" that import the DX series of Galaxy radios from the factory to the USA don't have the US "rights" to import/sell the Saturn, Turbo, Pluto & a few others, another company does. Same with Ranger's line of "Texas Ranger" radios. One Company imports & warrantees the 696/699/396/399 series, and another unrelated company brings in & warrantees the 296/193/6900 Texas ranger radios.....

SSB is generally a bit more courteous than AM CB,but you weren't even in the CB band(26.965-27.405 in 10 KHZ increments)If you operate illegaly who can you complain to when other interlopers are rude?
This will become the norm on any freqs you can tune your CB to,it's just a matter of time.The same thing will likly happen to the ham bands,just listen to 10 and 2 meters.
I hate laws and regulation,but I can see we needed them here and now we need enforcement.

>Can you peak those Cobra FRS-310WX radios? What can you do to them?

1. There IS an FRS newsgroup, but they are basically no help
about much of anything.

2. I own one. Peaking them is not practical. Do you know
much about FRS? I will explain. FRS is a high-efficiency, low power
system. If you increase your power beyond 1/2 watt, you will only
increase range minimally, but toast your batteries much faster. On
those small units, it is better to leave tham at a half watt, as that
is all they are powered for anyway.

3. If you want an FRS compatible radio that you can peak, go
GMRS. It has overlap with FRS, and is a higher power system. Also,
there are base and mobile units, so battery isn't such a concern.

Email me if you want more information on radio tidbits.

FM is 100% duty cycle so open the rig (illegal for CB) and adjust the
FM (illegal for CB) down to about 1 watt or whatever seems to give the
output you expect from the amp.Pay attention to the rig and amp getting
hot.And of course,amps are illegal on CB.

Thanks for confirming my long-time suspicion - if you listen to his song "Buttermilk Biscuits," you'll hear him make a reference to "mud ducks." When I heard that way back in the late 80's, I wondered if maybe he might've been into CB. :)

HILARIOUS song, by the way. Seek it out. You'll hear Sir Mix-A-Lot like you've never heard him before.

Your a fuckin idiot, wilby.

Most of the information on your page is bullshit.

The Ameritron not having a 10 meter position.. It doesn't have one because it is illegal you puke.

The 300A being the "Big Brother" to the Skipper? No, the Skipper was built to match the Skipper series radios.

The 300A and later the 350Z where built to conform to new regs being brought about.

And, Palomar used the same chassis as the 300A for the 350Z, but also included the transformer in it, along with the same 2X4 combination.

I bet you don't even know what the 2X4 was for? So you could put it in low gear and drive the amp with a standard rice-burner.

Your a lop. You don't even have the most popular amplifier in history... The veritable SB-220. Your also missing a pic of a Henry.

The Drake was the closest you came to a real amp, and it would only be considered for driver useage!

I have a 98 Ford Explorer, DBB. Sadly, I don't have the overhead console in mine. There is no telling how it is attached. It could have hidden screws, or could simply be glued into place. Call the Ford dealer and ask. They are amazing cooperative when asked nicely.

In my case, I was thinking about installing a nine-foot whip on the rear fender, with the radio bolted to the center console (the console between the seats). My center console stops right in front of the seats, so there is room to mount the radio there with the coax running under the passenger seat to the side and then back to the antenna.

Of course, I have to install a lot of radio equipment in mine. I have the CB to install, a ham radio to install, and, since I'm in the Coast Guard Auxiliary, a marine radio to install. You should have seen all this junk in a smaller Mazda 626 (the car I had before the Explorer).

The CB radio will get a nine foot whip, while the ham and marine radios will get magnetic mount antennas (antennas for marine and 2m ham are much smaller).

Good luck on your installation.

I laughed hard when I saw this, Stewart. At first, I thought it was a joke, but in reality it is probably good advice.

It reminds me of a guy that was complaining about his CB radio not working correctly. It turns out that he was trying to power it using one of those tiny wall-mounted power adapters designed for a portable radio ("it says 12 volts"). That power adapter probably didn't put out a tenth of the amps he needed for that radio.

You can get a wall-mounted adapter strong enough to power some radios (I used one with a handheld for a while), but some just don't understand that it has to rated at enough amps for the radio.

I need help deciding between buying a grant xl, a
texas ranger tr-699wx or a midland 79-290.
I am considering ease of modification and receiver
and transmitter specs.
I really like the 79-290 but feel that it is less
a radio than the other two.
After reading a bit on the web I like the texas
ranger. But I don't know how dependable it is.
Uniden grant xl. The standard by which others are
measured. Do the other two radios measure up?

Source record: 24004

I mounted antennas on the roof of my minivan and my Tahoe. Both have overhead consoles. The minivan has 2 screws at the very front of the overhead console close to the windshield. The Tahoe has one screw on the front end of the overhead console. After you remove the screw(s), the console drops down. Then you need to unplug the wires that go to the lights and any other switches that are on the console. There is a large 'tab' on the rear end of the console that holds that end up. Just slide the console forward a couple of inches and that's it. There is plenty of room up there in some places. Just watch out for some parts of the console that stick up higher, like switch compartments. You might not have enough room right above that part of the console.

What antenna did you decide on? The antenna I have up there right now is a 2-meter antenna, only 18 inches tall. I need to put a CB antenna up there now and haven't decided which one. I would like a fairly short one.

Hope this helps.

Hutch

As far as the amp is concerned Am and FM is about the same.
They are both a continuos carrier and I believe FM and Am
modes have the same output in most radios. If you have a
variable output knock, it back to around 4 watts.
Cheers
John

Hello John: Your always there with a warm and friendly thing to say to CB'ers. I monitor the FRS and GMRS all the time, out here in the Mojave Desert. I hear a lot of ham call signs given by mistake over the FRS channels. Seems its not to hard to modify the 440 ham radios, and trim a antenna to use the FRS and GMRS channels.

I have even heard them talk about your FRS news group, saying "What is John bitching about now" The basic conversation I hear, is how to modify the FRS radios for use of a external antenna, and use of a linear amplifier, and trimming the ham 440 antennas to work on the FRS and GMRS channels.

Love my scanner radio.

OK lets start over,
Radio is a cobra 148 GTL,
radio out 50 ohm coax 6 feet, goes down to amp come out 75 ohm.
75 ohm coax 6 feet to antenna,
antenna 58 "center- load, loads or 4",
antenna's are radio shack heavy-duty single trucker ll,
{ I no its a rad shack antenna but i have tried them all these do work
the best for me as far as transmit and receive
Antenna's are mirror mount's, 8 feet apart,
the antenna's are 65% above the cab, and the center-load is above the
cab by 3 "
All {+} and {-} are good. and the coax is top grad.
the radio will transmit and receive a good 10 to 15 miles with out the
amp.
the only time i use the amp is when i am out in no man's land,
The problem is they say to set each antenna's swr, then hock them
together,
I get each antenna set to 1.1 but when i put them to gather it jumps up
to 2.5 swr.
if i set each one then they are not the same length, they say they must
be the same
But if I set them as one I get them down to 1.2. And they stay the same
length
but the swr are not the same for each.
witch one do I go by.

pet peeves are bs, be a gentleman and no hassles. What I found odd
here after seeing the Letter was it was just a Warning. So much
Freeband stuff is not properly filtered and with mega power amps without
filtering, you can't help but be noticed. Sadly the old ham was a
bystander, he had spoken to the young man on occaision about the
interference but the cable co clued in the FCC after all was said.
Freeband has the POTENTIAL of earning you a citation, just as speeding
will earn you a citation. on any Interstate, follow the flow of traffic
and the speed cops are happy, start weaving and they mark you. same
with Freeband, stickout above the crowd and you will be noticed.
OLD RUSSIAN PROVERB-Longest blade of grass gets cut.

Source record: 24012

Thought you might like to see this email I got today. Forward to your friends and contact your congressman. It figures!: No more free E-mail?

We Knew this was coming!! Bill 602P will permit the Federal Govt. to charge a 5 cent charge on every delivered email.
Please read the following carefully if you intend to stay online and continue using E-mail: The last few months have revealed an alarming trend in the Government of the United States attempting to quietly push through legislation that will affect your use of the Internet.

Under proposed legislation the US Postal Service will be attempting to bill E-mail users out of "alternate postage fees." Bill 602P will permit the Federal Govt. to charge a 5 cent surcharge on every E-mail delivered, by billing Internet Service Providers at the source. The consumer would then be billed in turn by the ISP. Washington DC lawyer Richard Stepp is working without pay to prevent this legislation from becoming law. The US Postal Service is claiming that lost revenue due to the proliferation of e-mail is costing nearly $230,000,000 in revenue per year.
You may have seen their recent ad campaign "There is nothing like a letter." Since the average person received about 10 pieces of email per day in 1998, the cost to the typical individual would be an additional 50 cents per day, or over $180 dollars per year, above and beyond their regular Internet costs.
Note that this would be money paid directly to the US Postal Service for

a service they do not even provide. The whole point of the Internet is democracy & non-interference.
If the federal government is permitted to tamper with end.
You are already paying an exorbitant price for snail mail because of bureaucratic efficiency. It currently takes up to 6 days for a letter to be delivered from New York to Buffalo. If the US Postal Service is allowed to tinker with email, it will mark the end of the "free" Internet in the United States. One Congressman, Tony Schnell (r) has even suggested a "twenty to forty dollar per

month surcharge on all Internet service" above and beyond the
government's proposed email charges. Note
that most of the major newspapers have ignored the story, the only
exception being the Washingtonian
which called the idea of email surcharge "a useful concept who's time
has come" (March 6th 1999 Editorial).
Don't sit by and watch your freedom erode away!
Send this e-mail to EVERYONE on your list, and tell all your friends
and
relatives to write to their
congressman and say "No!" to Bill 602-P.
It will only take a few moments of your time, and could very well be
instrumental in killing a bill we don't
want.

AM has a carrier with modulation added to change the amplitude.
FM has a carrier with modulation added to change the frequency.

AM requires high linearity to be amplified with no distortion.
FM doesn't care about linearity because the information is INSIDE
the signal, not riding on it like AM. You can full max FM power and
still sound good because the amplitude changes are ignored by the
receiver. We won't confuse you and go into ratio detectors.

I was reading the mail on him(Prime) about a week ago and he was shooting to the mini grass. He came out and said, "someone had to finally teach ol Starship a lesson", well Starship put the maul on his butt. Starship is a bad dude but he aint that bad. Which comes to show you that with a little Mother Nature cant nobody stop you. What is really weird is Starship is approximately 50 miles from me, and Prime is like a couple of thousand miles from me at least, and I could hear Prime keying over Starship from where I was at. I didnt have any Northern skip and I could still hear Prime come fading in and out, taking out Starship.

I have a Radio Shack hand held forsale. TRC-225. It's in really nice shape! No scratches on it, maybe a few. Comes with antenna, strap to go around your hand, It has 40 channels, Has push to talk button on the side, along with the channel selection buttons so you don't have to reach at the top to change channels, a neat option! It's takes 8 AA batteries, maybe 10, not sure. It's all ready to go! Just put batteries in it, or plug a AC plug into it. Talks about 2 miles. Really a nice rig for the hunting folks out there!

Radio Shack TRC-225 Hand held cb radio- $25, plus shipping ($10)

Greetings!

I'd recommend using 9 foot co-phase harness...

Why?

The RG-59 [read 75 ohm] phasing harness requires [well, it needs] 9
foot travel on both antennas for it to work right.

Since you're using an amp - it may be amplifying the SWR reading due
to extra insertion and it's own complex impedances it provides.

Hope this helps.

BTW where are you checking SWR? At the radio or amp?

On Thu, 17 Feb 2000 07:21:32 -0800, while the modem was pondering it's
navel, wisler <wisler10NOwiSPAM@cs.com.invalid> dissertated the
following:

>OK lets start over,
>Radio is a cobra 148 GTL,
>radio out 50 ohm coax 6 feet, goes down to amp come out 75 ohm.
>75 ohm coax 6 feet to antenna,
>antenna 58 "center- load, loads or 4",
>antenna's are radio shack heavy-duty single trucker ll,
>{ I no its a rad shack antenna but i have tried them all these do work

Date: 2000-02-17 00:00:00 UTC
From: advanspec@aol.comburger
Message-ID: <20000217171520.18075.00000072@ng-cf1.aol.com>
Source record: 24033

>""I need help deciding between buying a grant xl, a texas ranger tr-699wx or a midland 79-290.""
The 79-290 has no noise blanker & generally a notch below the recieve of the other 2, although it will "do" a lot of channels if you plan on taking it "out of the country" to do the mod. The TX Rngr 699 uses the new 696/6900 type "board" , & if done up right is easier to mod & better output than the Grant,(there's even a labeled "spot" waiting for the 2nd final!) with at least as good or Better receive, plus built in WX & talkback.

1556. Titan II 10-Meter Mobile Radio Mod?

Newsgroup: rec.radio.cb
Date: 2000-02-17 00:00:00 UTC
From: Volfy <Volfy@ionet.net>
Message-ID: <88i5gm$99g$1@ionews.ionet.net>
Source record: 24037

Does anybody know how to convert the Titan II (also known as Titan 485)
10-meter mobile radio to cover the 11-meter band?

I was told the mod is similar to the Magnum 257. I also know it's different
from, and IMHO better than, the Eagle Sidewinder 400. I like this radio
very much and will probably buy another one if I can find the mod info.

Thanks in advance.

The clock on my Cobra 2000 is acting up. It sometimes goes back to 12:00AM at the moment the radio is turned on. Seems like everyonce in a while the clock display will flicker for a split second when the on-off switch is turned on and thats when it goes to 12:00. Wonder if anyone knows how to cure this problem. Thanks for any help.

These amps are as good as you can buy anywhere else. Most of the people on this group are not familiar with these amps because they were not widely sold like some of the others, if the price is right go for it. I would of posted earlier but I was waiting (like everyone else) to see what others had to say....

>

You probably don't want to hit the amp with a carrier of 12
watts. The max wattage you should drive it with is determined
predominantly by the amp itself.
If the amp only requires 3-4 watts to drive it to full output
then that may be the upper limit to tune the rig for. You may need
to perform an experiment which includes adjusting the rig for
varying levels of drive to see where the amp is comfortable.
You only want enough drive to run the amp just to its max output
when the controls on the amp are set to max output.
It's not necessary to back the drive off to allow for swing on
FM, there won't be any. But by the same token you don't want to slam
a bunch of drive to the amp because you'll only end up drawing more
current and creating more heat than necessary.
I am not familiar with the palomar amps these days. However I
have seen postings here that suggest the max drive for those amps is
in the 2-4 watt max range.
Personally, I am and have been a supporter of FM in urban
settings. This mode tends to produce less problems with the
neighbors. Also, it produces a lot less bleedover on the band.

HUH?? There are only 14 channels of FRS in the 460 Mhz band...
NOW there are 50+ CTCSS tones you can use BUT if a carrier is on
one of the 14 channels, you CANNOT use that channel with ANY PL
or CTCSS tone...your signal will get interferred with...
ALL the FRS radios have all 14 channels...the extras (like extra PL
tones) dont mean that much as far as operation...it does mean your
radio MAY stay quiet more often because you can choose a tone
that noone else can...but it doesnt mean you can use the channel
either!

Nope, they dont...GMRS is allowed more power, higher external
antennas (FRS is NOT), higher deviation which means better
signal to noise at the rcvr, and REPEATERS! Yes, the require
a license but they are what CLASS D CB WAS supposed to be..
And CB is NOT a hobby...it is a personal communication system
You want a hobby folks? Get a HAM ticket...I did at age 14.
and with the drop of the code requirement, even the GoodBuddy types
can get a license (unless they are too much a moron to take a test!)

Buy the appropriate plug for the back of the V.F.O. Using a TWO conductor wire, solder one wire to the center pin of the connector, and the other wire to the outer 'sleeve' connection. Unsolder ONE of the channel crystals from the board in the radio. Now solder the other TWO wires from the V.F.O. to where the crystal was. That's it! You will lose FOUR channels on the radio channel selector, but you'll make them up with the V.F.O. On the BOTTOM of the V.F.O., there are two fine-adjustment screws. One is for C.B., and the other one is for H.F.
Hope this helps...

A.E. 352

There is no "swing" on fm so what you see when you key up is what it will do, keep in mind that your amp will run very hard on FM if you try to see the same the same output you see on AM. Be careful.

You need Bill Good to look and UPGRADE that radio. He is the ONLY
one who has ENGINEERED modifications for that radio. Heck, he should
know how it works; he re-engineered those radios for Ranger! Its too
bad Mr. Ping says, "PISS ON YOU" to the US CB market. If he would
just install all of Bill's upgrades....and not just some.

Bill Good upgrades these radios and is the best at it. Ranger won't
(can't) and they don't care about you.

I have to admit, all the odd features on the 699 left me wondering if
there were any switches on the radio that I could convert to band
selector switches. Is it possible to use any of the existing ones, or
do you have to install new ones in an inconvenitent place? I am
assuming, of course, that the channel mod. requires two SPST switches.
I would appreciate any more info you have. Thanks in advance!

Paul

>
>
The Siltronix vfo's have a pretty wide bandwidth regarding the
output power vs. frequency. I doubt it is the vfo's fault that the
power is dropping off quickly.
I remember the Eagles w/vfo. The aprox frequency range from a
stock radio was about 50-55 ch.s from where the lowest frequency the
radio is tuned for and the highest. This means if you tuned the rig
to cover ch1 the highest freq you'll see with decent output will be
about 55 or so.
As you undoubtedly discovered, the bandwidth of this radio is
poor at best without special tuning or modifications. It is
extremely rare to find a rig tuned well enough to just throw a vfo
on it and get the max bandwidth without tuning.
You can retune the rig to cover about 60 ch.'s across the band
with good power but this is time consuming and tedious. You can also
mod the rig for more bandwidth and this requires test equipment,
time and a few parts.
Good luck with it. BobC

If I remember correctly both the Canadian and US Gov't's
used the term "deregulated" with reference to CB. Having
said that, causing public damage (i.e.. jamming of or
interfering with other electronic communications) is a
different issue. That is like causing damage to public
property.
Cheers,
John

Richard:

Please take a good look at your FCC license. I do believe that it conveys all the privileges within the US and it's teritories and with all treaties laws, orders, and rules and regulations. It does not guarantee that you will have privileges everywhere in the world. It is the treaties that grant you privileges in other parts of the world without having to take an exam. This seems to be a major misunderstanding that has now arisen. Just because your are an AMerican with an Extra class license gives you squat in Singapore without their permission. It is a treaty with both countries that will allow you to operate without having to take a test in that country. Yes there will issues in the near future where reciprocal aggreements will need to be ammended and renegoitiatied. In the short term you may suffer for the lack of operation in a foreign country. These will be ironed out in time. Remember the US is not the only country restructureing. This is a wave that is sweeping over many countries. It may take some longer to implement changes. Changes are on the way. They are inevitable. But as for the license granted by the FCC, you technically have not lost any privileges within the US and it's territories. This is a fine line but it is so.

regards
james

Yeah its a good amp. They stay very cool under extreme heat. Had one
for 4 years and no problems but traded it and a few dollars for a
bigger amp! If you get one for about $100.00 - $125.00 New, Go for it.

> The best ones I've seen so far...

The Vertex VFX-10 and the original Kenwood are my two favorites of the scores available. And the Kenwood is available for only sixty bucks each now.

The Vertex is elegantly simple to operate: just to knobs. ON/OFF VOLUME, and CHANNEL SELECTOR. Couldn't be easier to operate. Slim and sleek, and a full 500mW output. If you're in a busy area, it has 6 DCS codes for privacy. Built bullet-proof. When I test HTs, they get dropped from three feet into a bathroom sink - the Vertex' plastic case is great.

Want "bells and whistles?" Then look at the original Kenwood. CTCSS, audio inversion voice scrambling. LCD readout. Scanning with their speaker-mike attached. Although "only" 300mW output, this fact did not really make much of a difference in communications test as far as distance was concerned.

The Standard FRS unit is now discontinued - Vertex acquired it, and is maintaining their own FRS units.

They may 'call' it 'deregulation', as in a decrease of regulation...
just as the Airline Industry was deregulated. To say that deregulation is
synonymous with 'no regulation' is to ignore the facts. Check the FCC
website or pick up an FCC rulebook... Only the licensing requirement has
been dropped for CB (ages ago), all the rules and regs are still on the
books and enforceable should the FCC desire. Admittedly, there has been
little enforcement for years, on both the CB and Ham bands. Word is, that's
changing. (in fact, this week's FCC Enforcement Bureau weekly report lists
a $20,000 fine levied on a Florida man (non-ham) for deliberate interference
(HF and VHF... also listed on the ARRL website).

Anyone who has an old 148 thats goof for parts heh, basicly all i really need is the bottom cover, the faceplate and the knobs.. Thats all thats left to finnish this old R.O.C radio i found that was blown to hell and back.. Got it working like brand new and all i need is the cosmetic peices to finnish it off. The covers i had were drilled, rusted and just all screwed up and the face plate was missing all the lettering on it. The knobs were already gone when i found it..

If anyone has any of this in good condition, no holes drilled in them, gouges, print missing from face plate etc.. i would be interested in them.. Cobra wants way too much for replacements.. course, whats new?

David

I beleive that the 640e is a repackaged AX144.
You can modify, but only using an external oscillator to replace the loop
mixing crystal.
No cut and switch here.

Bob, re:

> I remember the Eagles w/vfo. The aprox frequency range from a
stock radio was about 50-55 ch.s from where the lowest frequency the
radio is tuned for and the highest. This means if you tuned the rig
to cover ch1 the highest freq you'll see with decent output will be
about 55 or so.

Perhaps the tuning on the VFO itself makes a <big?> difference, but I found that the power drops off significantly past whatever channel you are "peaked" for--not on the radio end, but the VFO end. For example, if the VFO replaces channel 23 and the VFO is tuned there accordingly, as you get away from channel 23, while operating the VFO the power simply drops right off, as evidenced by the spot button and external watt meter. When you switch back to crystal for the same given channels, it works fine--so this is not a function of how the radio is peaked--but the band spread/power output of the VFO itself, versus a crystal. At first I thought it might be the cable length from the xtal socket to the VFO, but when you take the channel 23 crystal and plug it into the socket in the VFO, the power output is just fine... I've used the crappy Diamond 10 VFOs (which I've modified to double their output) for years and never had this problem--again, it might be a tuning adjustment on the bottom of the Siltronix, but I was very disappointed with my initial hookup...

It has to do with design and calibration. What one company uses for a power standard another uses something else. You don't really need to worry so much about which is best. Just use it as a reference for showing you the condition of your antenna, wattage and modulation. In other words get to know how your wattmeter works with your station and check to make sure it is working the same each day. This way the first time something changes on your system like loss of power, weak modulation or high vswr, you will recognize immediately by the change in readings on your wattmeter.

I've got a Palomar TX 75 broad band 3-30 MHz mobile Linear Amplifier
that I'd sell for $75.It shows 240 watts on my radio shack watt meter.
Of course, it has a pre-amp, and a switch for side band or AM.

I also have a chestnut 50 watt (tube type) base amp. It'll tweak out at
about 55 watts. I'd also let it go for $75. Or both of them for $140.

If you're interested in either of these, contact me at wtv7@webtv.net

Thanks
Steve

hookup...
>
It would be difficult to use the spot button for your test. Yes,
it's entirely possible that there is a difference between the output
of the xtal osc and the vfo when spotted in on the same ch(23).
However, your spot button test doesn't hold unless you can provide
an xtal for the freqs outside the normal 23 with which you can
perform the same comparison.
The spot button test is unreliable at best because the rcvr is
subject to the same bandwidth limitation as the tx. The rcvr
sensitivity also drops off as you migrate farther from its "tuned
center".
Ideally you would have a hi freq scope or maybe a spectrum
analyzer or even a decent rf probe in order to measure the output of
the vfo on a dummy load of some kind. You could even use a gen.

coverage rcvr with an "s" meter to make this test.
In order to maximize the bandwidth of the tx you'll need to add
either a resistor across some of the mixer output coils(to "de Q"the
coils) or change the C/L ratios in the mixer circuits as well as
some of the amp stages. This can be done but like I said, it's time
consuming.

If you want the supply to be regulated, you'd better get a higher output tranny than 12V. You need some -overhead-. Building the regulator will be the hardest part. If I were you I would be inclined to try and fix the noise problem on the supply you have.

Scooter, it is interesting to note that the shit-disturbers are almost always from the good ol' USA. Many CBers like to behave like their -ideal self- on the radio. That is to say, they typically behave like they wish they were - which is invariably quite opposite of what they really are. Ie: all powerful, controlling others, getting lots of attention, acting selfish. The behavior is merely the symptom of underlying problems. In my experience these problems often include unemployment and alcoholism.

Sad but true....

MC

Bob, re:

> It would be difficult to use the spot button for your test. Yes,
it's entirely possible that there is a difference between the output
of the xtal osc and the vfo when spotted in on the same ch(23).
However, your spot button test doesn't hold unless you can provide
an xtal for the freqs outside the normal 23 with which you can
perform the same comparison.

My point is, is that the spot botton parallels that of the external watt meter.
The VFO seems to have a very limited output outside of it's "peak" range.

The clock on my Cobra 2000 is acting up. It sometimes goes back to 12:00AM at the moment the radio is turned on. Seems like everyonce in a while the clock display will flicker for a split second when the on-off switch is turned on and thats when it goes to 12:00. Wonder if anyone knows how to cure this problem. Thanks for any help.

No I didn't miss the point nor was I trying to slam anyone. I was just trying to point out the dangers of doing this. I have done things like this and they were a lot of fun looking back on it, but I wish someone had given me a little warning. I would have saved a lot of money. Blew up my after factory electronic ignition. This was an expensive lesson back then. Today I would be wiping out a computer and god only knows what else if the voltage got back to the rest of the car.

personally , i think some of the prices for radio equipment on there are to put it bluntly , ludicrous, . some people act like these little cobra units are the only ones left , or something , without considering what they cost new. i think you have to know your prices, but you can get a good deal sometimes. recently i saw a turner plus 2 microphone go for over a hundred dollars. now i don't know why people think this is such a good microphone. i think it has a lot of history and a lot of hype but to me, they make your radio sound not all that good. i think the d 104 night eagle is a much better microphone but hey that is just me. anyway this is cd and i am back in the bushes, lookin.....

well i just looked at the stargun antennas. very impressive. but do they work? what are the swr situations associated with this type of beam system located so close the the ground plane? i would venture to guess these antenna systems are for keydowns or for those who drive their long noses over to places where there are no people around in order to key up their big radios. but for driving around, i think it would be safe to say , it is strictly out of the question. however i have seen people driving around with beams on their trucks . whatever, it looked kind of silly and made you stand out like a sore thumb, if you will. with twenty years of research and development on the line here , i would also surmise that these things will not go cheap. anyway, i stand at the cross roads with my radio shack 102 inch whip and spring and say , i am just plain curious, cd and i am back out.....

for how long though, three belts, geez i sure hope you didn't run any
extra belts off that water pump there good buddy, anyway there will be
wear and tear on those bearings all the way around. three belts throws
off the equillibrium of the engine and does things that at first you
can't see but will eventually cause problems. too bad though. nice
looking engine. it should be put in a racing car and not a keydown
vehicle. all that money , my , my . and for what? so you can outkey
somebody in dallas, and that is as far as this situation is going to
take you and you all know it. you cute little fat red shirted goosey
boys never win anything when you leave dallas. personally i think the
fix is in at dallas and that is my roger. anyway this is cd and i am
back quiet

Greetings,

Has anyone out there successfully disabled the transmit frequency shift on the clarifier control? As you know the clarifier shifts the transmit frequency along with the receive frequency, which I find really annoying. I much prefer to have RIT (Receive Incremental Tuning) only. Any help will be greatly appreciated.

Well Mike a few years ago the pound sterling was not worth a cup
of cold p*ss, however things have changed around here. It is one
of the strongest currencies in Eurpoe sorry make that the world.
Beats me why though because the chap that runs the finances in
this country is selling off the gold reserve that backs it. I
personally reckon he has got sh*t for brains, but then again I
never voted for this shower of crap that calls itself a
government. I know I keep on about it, but six of your dollars
for a gallon of gas is frieken piracy. The guy that advocates
the huge cost of gas says the tax is a green measure, then the
joker admits to owning not one but two Jaguars, the biggest gas
guzzlers of the lot. You think that your country has problems!!!
Amway mike what do you think of $200 for an Astaic Echomax 2000
mike or $125 for a Solercon 2000 would you stand for it in your
country---I very much doubt it.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=263258690

IT has no bids and is a great investment. I bought this new on 10/20/99 and have not had much time to use it because I have moved and recently became engaged. E-Mail me with questions. I live in Newark,De and will sell my antenna ANTTRON305 to the winner if they are near by for a seriously reduced price to include good Belden coax. I also have a pair of JO Gunn 4+4 star antenna that I need to take down. It has a Yeasu 450A Rotor. It is in great shape and SWR are only 1:2 on both vertical and Horizontal. Made contact with Tahiti back around Christmas.
Mike

for how long though, three belts, geez i sure hope you didn't run any
extra belts off that water pump there good buddy, anyway there will be
wear and tear on those bearings all the way around. three belts throws
off the equillibrium of the engine and does things that at first you
can't see but will eventually cause problems. too bad though. nice
looking engine. it should be put in a racing car and not a keydown
vehicle. all that money , my , my . and for what? so you can outkey
somebody in dallas, and that is as far as this situation is going to
take you and you all know it. you cute little fat red shirted goosey
boys never win anything when you leave dallas. personally i think the
fix is in at dallas and that is my roger. anyway this is cd and i am
back quiet

Explain how,almost anything I have read on installing amateur gear including amps recommends starter post instead of the battery.What would be the point of using the batt other than it's accesability?
My personal experience also tells me the batt isn't such a great spot,I have seen many CBers wanting a new amp when their "finals were weak" then I redid the rotting battery connection and everything was back up to par.

Well, I will tall you that you cannot get parts to fix it. Just ignore it and use the radio, enjoy what you have, they do not make them any more and believe it or not, the company cannot fix it, or will not fix it. I tried with my Cobra 2000, I enjoyed it very much and it really looks great setting on the desk. More like it belonged in the office that in the car. Great radio! Lost the clock and the led for the channel selector, could not get it replaced, searched for three years.

No this is not common to these radios, that particular radio is having problems. Get it fixed if you can before the led goes out on it. IF that happens, forget it, there are no spare parts even at cobra.

Greetings!

No, just a straight 40 channel CB radio, based on the PB-122 [PC-122, Pro810e, TRC-453 and Cobra 146 GTL] lines...

Theres' actually a lot you can do with the radio. As far as frequency expansion, you need an "N" kit. It swaps the PLL freq crystal to another crystal. The problem is with the install of the switch to do this. There's little room on the front panel, but the rear panel and if you find a low profile wafer switch, the speaker side clamshell can house the Xtal to make the frequency change. Not a big deal if you have the room or use the radio on a base.

It's not an easy install, nor quick, but any competent tech can do this.

One word of caution, the use of more power from the radio by turning up the AM Power control is not recommended. You'll actually lose modulation and cause more heat to be generated. There are a few mods out there that can reduce the heat problem significantly - extending the life of the radio and producing far better modulation.

If you want real power, then a linear will have to be used.

From: Adam Lind <chip1@TheRamp.net>
Message-ID: <sb0928sr2a85@corp.supernews.com>
Source record: 24324

I have for sale a Cobra 2000 Base Station CB and an Eagle Tomahawk 10 meter rig.

First, the CB. The Cobra 2000 is in good condition, except the frequency counter and modulation meter do not work. I have a set of meters that go with the rig (measures power, modulation, and SWR), in addition to an Astatic desk mic (echomax). There are no mods on the rig at this time, but I know some are available. I am asking $165 for the rig, meters, and mic. I have the box and documentation for the mic, but not the meters or rig. Everything works like it should, except for the meter and counter, but they do not impede performance.

I also have an Eagle Tomahawk 10 meter rig for sale. It is in brand new condition, with only about 2hrs service time on it. I have all boxes, documentation, etc for it. Comes with rig, hand mic, power cable, mobile power cable, box, and documents. Asking $180, as it is not even 2 months old, and in mint condition. Rig is stock, but there are mods for it.

If interested, please email me.

I was just wondering if you had tried out the CTE M400 copy of the Starduster?
I ordered one to try out and I see a lot of minor differences, but don't know if they are going to make any difference--any input?

I was favorably impressed when I had a Starduster at approximately 100' and a PDLII at 80'. The PDLII worked great when the skip was running and also I could turn it away from Seattle and Tacoma when they were louder than the station in Ranier Oregon that I was trying to talk to. I was slightly south of Olympia,WA. The Starduster worked Great for almost everything else that I tried to do using ground wave (local).

I have also heard about a copy of a Sigma and am interested in trying out any copies or ??

The antennas I have used are the AstroPlane, Golden Penetrator, Starduster, Radio Shack 5/8 wave, PDLII, Shakespeare 1/2 wave fiberglass, Droopy Drawers (1/4 wave),

I would appreciate your input on the sigma copies, and any thing on the cte copies.

Thank You for your time and expertise.

Source record: 24328

Greetings!

A 35 amp at 12V transformer? This is going to cost some money.

It would be easier to use a car battery, or a series of 6V motorcycle/Trolling motor - deep cycle, batteries along with a simple 12 V lamp for turn signal from an automobile. Even using 4 - 3.6V gel-cell batteries capable of 25Ah, can get you to the capacity you need.

Not sure if the switching power supply has variable voltage adjust for the 12 volt side - if it does then you're in luck. Find the range of adjustment [peak voltage it can produce] and locate the switching power supply some considerable distance from your station. Some "Monster cable" of 8AWG from Radio Shack can supply the distance needed with little voltage drop - and if you have these spare parts laying around a toroid core or choke to help reduce "hash" sent thru by the wires can help - along with some .01uF caps in the Power supply line to the battery bank will reduce the hash noise if the switching power supply is 10 feet or more away from your station.

The lamp is wired in from the power supply to the battery bank. The device runs from the battery bank.

When current draw is excessive, the lamp lights and due to the interent increasing resistance of the lamp, the filament will glow and the lower amperage power supply is not severely taxed as the device draws current for its maximum surge from the battery bank.

The lamp will stay illuminated indicating the battery bank needs time to recharge. The batteries recover and the lamp goes out - you're ready for the next surge.

This technique works for power supplies a low as 3 amps, and most small power supplies use a trimmer internally to set voltage. So, you'll need to boost voltage to get it to the point where is can actually charge the batteries.

To give yourself a cushion, you'll need about 18 volts. Most radios can't tolerate this high of a voltage, they burn up, but an linear can. If you use 3.6v gel-cells you can use less boost voltage and you'll have typical 14~16 volt output which is more tolerable to electronics designed for 12v systems.

Naturally the batteries will need time to recharge. To decrease the recovery time you need a 10 amp power supply and two automotive 12v bulbs, this reduces the voltage drop across two lamps and increases

charging current, and doesn't tax the power supply severely.

If you're into building your own, an LM1084 from National
Semiconductor can offer what you need to operate high-current pass
transistors like the 2N3055 - it will provide 5 amps of output which
can be used to drive the base of the pass-transistors directly.

I've got a PDF of the LM1084 if you're interested. Or you can get a
copy for yourself if you've got a search engine and can locate
National Semiconductor on the web.

http://www.national.com/catalog/AnalogRegulators.html

It might help if you've taken a look at their other information about
regulation and regulators - there's a some great information in PDF
format on their site.

I had a switcher that was producing all kinds of noise. Funny thing was it wasn't a harmonic of the switching freq as usually is the case. The unit had 4 input diodes in a bridge that rectified the 120VAC and the resulting filtred voltage wass about 150VDC that was fed to the inverter section. I found that by placing a .001uf cap from anode to cathode of each input diode the noise went away.

Hope this helps.

The one I had was keyed by a foot pedal. You should be able to use it on SSB if it has the manual key circuit. (Rather lack of an automatic key circuit) If it doesn't have a manual key then you may have one that has been modified and you might be able to switch it back to a manual key easy.

I happen to like the sound of the Turner +2 on certain radios, but
not all. The same way I also like the sound of the D104 on others.
There are also radios that the Super Sidekick sounds good on--but
none of those mics are worth more than about $40 to $50 in my
book as I can get other good mics for that amount.

Hello CH Thanks for your comments and you are totaly right.
If you were to see some of the equipment that is dragged out in this country which is almost antique and the prices that are asked for it you would p*ss yourself laughing. And some of the hard selling that goes on like *its got a lovely pair of ears mate* or its been in the manufactures box for the last 17 years, I mean you guys would not attach an antenna to half the rigs in this country. Now what I want know who is making all the money out of the new rigs and twigs that appear on these wonderful shores of ours? Just look inside a modern CB I mean theres hardlythe contents of the space shuttle in it. For example I donâ€™t know at what price say a Cobra leaves the USA but when it arrives here it costs about twice what you pay, why? And more importantly who is making the money. No doubt the dealers will merely shrug their shoulders and say *not us mate*
Furthermore I do not suppose there is much chance of any of the manufactures/dealers/distributors coming on line to throw in their two cents worth.
Or is there?

Hello C.H. Parsons: Good deal on the CTE M400 look-a-like Starduster.

I bad mouthed the Starduster a few mounts ago and got about 8 E-mails on the subject. Seems a lot of people like them. I ran a original Starduster back about 20 years ago, and I didn't like it, due to all the TVI I got with it. But if your going to have mounted up pretty high, it will work better, and may not have a neighbor interference problem. I am sure the CTE M400 will work just like the original Starduster Antenna, or so close it will be hard to tell the difference. The Starduster / CTE M400 is a quarter wavelength ground plane. And with the ground radials at a radical angle below the standard straight and level, and even the normally used 45 degree's down from straight and level, will act more like a center feed dipole, as compared to a ground plane with normal ground plane radials being straight and level, or down 45 degree's. This is done by the designers to get the angle of radiation or take off angle (elevation angle leaving and entering the antenna) lower to the horizon like a 5/8 wavelength antenna, but it appears to have a lot energy going below the straight and level horizon, causing some neighbor interference. In my opinion, I have not measured the Stardusters take off angle.

The 5/8 wavelength ground plane antenna has a much lower to the horizon, which will give a better local and long range skip performance. And if it has ground radials, it will have much less interference to neighbors electronics stuff. A lot of people think the 5/8 wavelength has a lot more gain than the 1/4 wavelength antennas, but its not the gain increase that is seen, its the lower angle of radiation that is seen.

The Sigma 5/8 was a great antenna. But I believe it was a little bit over designed. When Antenna Specialists took over Avanti, they had a improved version I am told, but I haven't seen one. It sure looks like the MaCo V5/8 was a common sense look-a-like version. With a better adjustable impedance matching network. The MaCo V5/8 is not made as well as I would have made, but it does seem to hold up to the high winds of the Mojave Desert. I have seen the vertical element after a long time wiggle out of its insulator base assembly, and the impedance matching loop gets hammered by big birds landing and taking off from it. Which appears to mess up the match. The MaCo assembly instructions say that the impedance matching loop, must have a 1 inch clearance between the lower and upper sections. But when the birds do Touch and Go's off the loop, it gets all bent out of shape. One of the locals here has made a trick kit that installs onto the MaCo V5/8 that installs insulator type spacers on the loop, making it much more steady. And they have added a special clamp to hold the vertical element in its place.

The PDL II was a great antenna, and did not receive its fair share of credit, in my opinion. For a small 2 element Quad antenna, it sure kicked ass, in the gain and rejection spec's department.

Hope this helps, & 73's Give me a blast if ya need more opinionated biased views.

Jay in the Mojave

Question: Why are ham operators posting here? Remarq has a
group just for this. Most hams I know would not be caught
dead with a c.b. to hear them tell it.

They always piss and moan about how they got thier license
and now operate on the legal side??

Here is my conclusion: They have discovered just how boring
it is and just cant pull away from the c.b. This is a riot!

Yaesu FTDx560 HF Tube Transceiver 10-80 meters,
plastic still on faceplate, excellent condition
with copy of manual $250.00 (Pending Sale)

Yaesu XF-32A SSB filter for FT101 series, $40.00

Crown IC-150 Stereo preamplifier, Metal cabinet
model with copy of manual $150.00

Midland 79-290, removeable face 10/11 meter AM/SSB/WX
Mobile,dual final design, 5 bands, WX, good condition with
stock mic. $120.00

Commercial VHF Handhelds:
Motorola Radius P50
Kenwood TK240 with drop in charger
Reasonable offer

Homebrew 3 tube 10 meter amplifier, uses 3 military
versions of the 6146, Seperate open chassis PA and
power supply deck. RF sensing, Plate Load, meter, SSB
and AM. 150-200 watts with low drive $150.00 Reduced to$130.00

Kenwood TS430, with AM filter and FM board, Manuals, Clean and working Great
$400.00

Browning Mark III, AM transmitter and 2 AM/SSB receivers, working.
With 2 non-working parts AM/SSB transmitters and 1 non working
AM/SSB receiver. Complete Package $400.00

Tram D201s, Both have unlocked VFO's, One has lower freqs
with good AM and weak SSB the other has upper freqs with good
AM and SSB. Both in good condition $250.00 Each

Penetrator HB-150 10/15/20/40 meter Mobile amplifier, 150 watts class AB1
Low drive input required $150.00

Hooker 10 meter Amplifier, 1 pill design, PEP and RMS mode, CW/AM/SSB,
Preamplifer, Clean, still has factory seals $75.00

Pacifc Scientific / Superior Electric 2 Axis Servo System $250.00

Tram Diamond 60 AM/SSB Mobile, SIltronics Model 90 VFO -3 and Paradynamics
Mere, All in good working condition $175.00

VHF Trielectric Amplifier 13.8 VDC As Is $40.00

Motorola UHF 13.8 VDC 450-470 Mhz Solid State Amplifier, Surplus, As Is $40.00

1738. Plate transformer avalibility?

Newsgroup: rec.radio.cb
Date: 2000-02-20 00:00:00 UTC
From: Speedbuggy714 <galaxy1@zoomnet.net>
Message-ID: <sb0oqbi8r2a29@corp.supernews.com>
Source record: 24407

A few weeks ago someone posted on here that there was a guy that built and sold Plate transformers at about half the price of Peter Dahl. I wrote the author of this posting and he sent me an Email address of the builder/seller.
Well I seem to have misplaced this address. So I am hopeing that the original poster that provided me this information will see this and provided it again.

OR

Anyone else that has information I would gladly welcome comments.

Basically this is what I need.. A good used stock plate transformer for a Heathkit SB 220 or 221 amplifier. Or a cheap new one would also do. If anyone has a used one in good shape laying around that they would be willing to sell let me know. I know some folks like to take the stock one out and add a larger, higher voltage Peter Dahl or the like. Then this leaves them with nothing to do with the stock good one that was removed. This is kind of what I am looking to buy.
I am repairing one of these amps for a friend and he doesn't have to much to spend on it but his transformer is shorted. Another new, rebuilt or used one is needed.

Any help is greatly appreciated!
Please send comments to me via email as I haven't had much time to view this NG on a regular basis.

Thanks!!!!
Mike

Gotta disagree with you there.

Midland 75-510 Models (yes, there are a few) have a removable
antenna (4-40 US threaded connector) and even an optional mag-mount
car antenna. The FCC mistakenly approved them, and now they are
grandfathered, even though no more are being made. I have some of
them, and I must say, they kick ass. The antennas can be bought for
about $30 and are worth every penny.

1745. Temp Antenna

Newsgroup: rec.radio.cb

Ok here's a question for all you antenna wizards out there...
I'm putting up a new base antenna in the spring, waiting till then due to +7" or so of snow. Till then I need a temp antenna. I'd like to use one of my spare mobiles if possible, But they need some sort of ground plane. I have a Wilson 5000 I'm not using right now. awesome antenna,.. with a truck underneath it. I also got a k40 laying around I could use. Both have the same prob. being mobile magna mounts mobiles, no ground plane.
I'd spend 20 bucks or so but I don't want to go overboard 'cause I'm putting up a tower in the spring. I saw a TSR 100 - The "Tri-Star" - Radio Antenna Ground for $11 but I don't know if that will mate with one of my spares, or if that's even the way to go.
any thoughts?

Had a lot of fun talking local with a little willy stuck on the freezer,
seemed to work ok for local, mounted it to a bed spring one time and it,in
the house,acted like a beam, still never figured it out as to why, a friend
stuck a mag mount inside a garbage can lid ,acted like a direction finder,
experiment with it , that's what's fun about this hobby.

I got news for you. The TX frequency moves anyways. It is normal
for this type of radio to drift with temperature changes. If this is
the case, and it is, then why would you want to take away the ability
to correct this problem by un tieing tx to rx?

AM signal.

Agreed, but the chances of that are pretty slim. You'll be out
of the rcvr passband well before you can really bother the ch's
above and below you by very much. Of course, you can intentionally
overdeviate the system just for the purpose of being a pain but I
don't think many will follow this path.

I have one. It's a heavy duty small beam that has survived a severe ice storm and heavy winds.
It can be assembled in an afternoon raised by one person no problem. It's a pretty thing flying over head.
The horizontal and vertical polarity works as advertised knocking out 3 to 5 db of noise each way.
The beam at 45 feet will out talk my I Max 2000 at 70+ feet with an increase of 1 to 2 db at my friends
house 15 miles away. I use it mostly on the flat side and have talked all over the world no problem.
Front to rear and side rejection is impressive for a small beam and makes a difference. In terms of talk power
being 28X, who knows! This is just my experience maybe not everyones.

Take an electrical 1/4 wave of heavy wire,pipe,300 ohm twinlead(shorted) or whatever and hang it out a window ,from the roof peak or any support.Tie the center conductor to this and to the braid tie 3 or 4 horizontal 1/4 wave radials.Should cost from 0-5 dollars.

You can either change the reference voltage or the feedback voltage(-divider ratio). You have to be careful there isn't a crow-bar circuit in there that will be tripped. Easy to change this too though. Do you have a schematic? Send it to me and I'll show you.

All I will add is that if it is for an RF amplifier you can use a thicker porcelain insulator and reduce some of the capacitance to the heat sink. You will lose a little thermal conduction though. If you look in many CBs you'll see that's what they do.

Is there any way to test these in the circuit?, if so, how?.

If not, can I pull them out and test them somehow with a cheap digital multimeter?

How critical is it to get the correct final/driver set?.
I have some old "A" band rt's (approx 40 mhz), can I use the driver/finals out of here?

The eagles were 'FCC TYPE ACCEPTED' no way the tx could have a VFO, besides I pulled out my MARKIII schematic. Defintely crystal controled. The rx was tunable. There was a guy down in Jacksonville FL that made a box that connected between the tx and RX that let you use the vfo in the rx for the tx.

I think this is pretty much a Peter Dahl stock item and runs cheaper than his custom built transformers and are much better than the origional. Think there was also a mod that changed the bleeder resistors on this amp so they draw a lot less current.

Overmodulating AM puts you out of the passband of the rx and they do it, why not on FM too. All it takes is figuring out how to put the plug on the power mike.

Perhaps because we also own and operate CB radio equipment. Many of my friends do not have a ham license, so I continue to talk to them on the CB. That does not take anything away from my enjoyment of ham radio.

> Remarq has a group just for this.

There are nine ham radio newsgroups that I'm aware of. However, I'm sure there are a few more that I'm not heard about.

> Most hams I know would not be
> caught dead with a c.b. to hear
> them tell it.

Obviously, you heard wrong - not all hams have that opinion.

> They always piss and moan
> about how they got thier license
> and now operate on the legal side??

CB is legal. Certain activities with a CB are illegal, so I (and I'm sure most hams that operate on CB) simply avoid those activities.

> Here is my conclusion: <snip>

Sad that you would form such a conclusion about something you obviously know so little about.

Howdy ,
I have just picked up a 148 with extras . It has this big knob on
the side . I've been trying on the air to figure out what frequencies
are in it when I put the knob in different positions .
A trucker one day mentioned something about a cheat sheet , one of
these I don't have . Seems like I could use one as I don't have a freq.
counter and was wondering if someone out here could HELP me .

Any help greatly appreciated . Thanks .

i really doubt that will happen. Better yet I hope it does not for a few reasons. First of all it would accelerate the migration of typical 40 ch behavior to our freebander real estate, the hard core hams would cry for years and we would have to see the sour grapes in the news groups. As a matter of fact I expect to see a bit more enforcement now the code requirement has been relaxed. As for me see you on triple nickel. i transmit therefore I am...

look at manufactures gain claims lie miles per gallon. The manufacture tests there own product in a perfect environment and then bumps up the results at the marketing point. I know nothing about the antenna personally but it does seem a bit high. do some research into the basic design type and check out the type with the arrl antenna and book and you will be back to some semblance of reality.

I had pretty good luck with a 102 whip and a mrror mount. I took the mirror mount and screwed the half with the so239 assembly directally to the roof drip edge on the veritcal facial board. Made sure of a clean connetion
between the mount and the drip edge. Got some decent height (20tf or so) and the whole drip edge worked as a ground plane. It was a bit (not drastically) directional. I then put up a ground plane at 75 feet and saw the diffrence. To this day I am a firm beliver in a great antenna system will make a medeorce radio station into 5x9. But this will get you on the air in minutes.

> mike.
----------------BobC wrote
I would disagree with you in that mic plugs and power mics are
not necessarily the evil things you suggest they are.
On AM, I say there are 2 basic reasons for excessive channel
bandwidth. The first is the removal or disabling of the modulation
limiter circuit, the obvious result of which is distortion and
attendant increases of IMD. Even a stock mic can drive the modulator
circuit to distortion.
Secondly, and regardless of the condition of the limiter
circuitry, is the lack of bandwidth filtering in the modulator
circuitry. Many/most rigs will reproduce a audio tone frequency well
outside the necessary range for voice communications. Even if the
limiter circuitry is intact and adjusted correctly this wide
frequency response easily puts parts of your voice into the channels

above and below you.
For an FM signal to reach the next channel you would need to maliciously misadjust the limiter circuit to the point that your "on channel" signal would literally disappear during modulation. Again, a mic plug and power mic alone are not commonly the cause of a wide Fm deviation.
While on the subject of FM I reiterate that this mode is superior for locally crowded bands because it doesn't, under normal circumstances, produce the excessive channel bandwidth as easily as a AM rig and it doesn't appear on the neighbors stuff as readily as AM.
I will go a step further, because I know there are radio aficionados here, and agree SSB would be the better mode for range with the least power and bandwidth but akin to an AM signal, the interference to your neighbors stuff will still be more noticeable than FM.

1815. Re: 148 GTL mod Help

Best thing to do is get a frequency counter or have some one with a modified 10 meter rig help you locate the channels and write them down as you find them. Every mod in a 148gtl can be done different and I have seen over 4 different ways of doing them, so over the net might not be too successful.

Here is the approach if you have a friend with a 10 meter rig: have him scan the band knowing that he only needs to search from 26.815 to 28.085 which is the general coverage of a 148. Go to each setting on the knob and using all 40 channels per each knob setting. just sit there and make a bunch of noise till he finds you and be sure to unkey from time to time so he can let you know he found you.

The easiest way is to go to http://www.copper.com and get one of the frequency counters that hook up to your antenna output for about $30.00. They are not the best, but they work good and will get you what you want in minutes instead of hours!

Source record: 24397
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.cb,rec.radio.amateur.equipment

I'm trying to build a little circuit to make a relay close
when a signal is received by a radio. (Cobra's and midlands (FRS) are
what I'm working with).

I want to use the speaker port, but my problem is that the
speaker always has voltage across it, squelch regardless. Anyone who
knows audio circuits knows about this problem. Can anyone think of a
way to check "speaker activity" through the speaker port? Anyone
perhaps have a schematic sitting on the shelf? I'm not looking for
anything too special, just to close the relay to trigger my event.

Any and all help appreciated.

>mic, like for $39 good ol USA dollars,they sound about the same, also in
>looks too!

Do not buy these mikes (Paradynamic PDC67), they sound like crap and it has the RB from hell. If you want a bassy desk mike, buy Sadelta. A trebly mike the echomax.

1823. Re: Cutting K40 whip

Newsgroup: rec.radio.cb
Date: 2000-02-21 00:00:00 UTC
From: Gary Danaher <gdanaher@home.com>
Message-ID: <38B08ADC.4E0B8253@home.com>
Source record: 24442

When you finish, you will have taken off close to 6 inches, but by all means, DON"T cut more than an inch or so at a time, and when you get close, trim an eighth at a time. If you have an antenna analyser, use it to check the resonant frequency and do it after each trim. Set the radio down at 28.001 and key it at that point, and when you finally have the antenna close there and the swr begins to rise as the frequency increases, trim just a tad again and follow the point of resonance up the band until you get to the point where you most commonly operate. It's real hard to make that antenna longer if you get it too short!

Exactly...You are talking 20 year old mikes here, the SSK had the compressor, and worked well, but over the years some have been dropped or left in boxes unused with subsequent damage, and swap meet prices at the fests usually end up at 20-35 dollars...for new modern rigs we are looking at varying impedence requirements, and like the echo or not, Sadelta mikes can be damned good sounding with the toys turned off, personal favorites are the little Ranger SDM1000's that have good response and pack a good whallop while being a VERY small footprint on the desk.

25LTD's bringing over $100 used, 29s even more? A good clean early 29 50-70 dollars tops with maybe an upgraded mike, hell there are good SSB rigs like the early RatShacks and Roadtalkers that can be modified and have a good chassis available for 50-75 dollars.

Do some shopping before you go wild...

I would try using a different antenna--but I have had bad luck with the
2 fiberglass antennas that I used. I like the 5/8 wave aluminum
or an M400 (Starduster copy) type. You could also get a
power mic or raise your antenna. Maco makes a 5/8's wave
antenna--but the M400 is only $40. I don't know what your
situation is, but I live in a low area and talked to a guy about
20 miles away using a magnet mount on my refrigerator!
Of course there was no skip running at the time and it was
very quiet on freq. AND I live on the 3rd floor of an apartment
building so my refrigerator is over 30 feet up. Oh yes, there is also
a copy of the old Astroplane antenna that works well--
I got rid of mine because it wiped out my neighbor's tv
since I had it at about 30' and that was the exact height
of his tv antenna.

So ,why as a free people don't you think its ok to have firearms to defend yourself, your family,or your country if necesary,its already been proven over and over that,crime in this country is the lowest in area's that citizens posses the most weapons???????? Unfortinately what get the media attention are the crazy's , criminals,and the 3rd world nation thats arose within the urban decay of this nation,thinning its ranks of drug dealing punks,very few law abiding gun owners black ,white,or of any creed contribute to the urban violence,if anything they tend to quell it ! I myself wont sit in this NG and endorse any canidate ,but will say that a nation without the freedom of gun ownership is a RULED nation,not a democracy,where as the people are self ruled! History should play a part in our judgement on such issues,Hitler and all, and if anyone has ever studied any of the communist rules of revolution,they would see that these concerns are all pertinant,to controling a society,first off getting them all worked up about issue's that have little to do with government,sporting events and such,people tend to pay much more attention to who's playing this weekend or if the neighber girl has the right to an abortion, rather than if our government is giving its military secerets to the Chinnese! , nuff said

Yeah they bring back good ones for me also. Not to mention all the old
radios I STILL have laying around. I had a stack of base radios that
was about 5' high from the floor using the biggest at the bottom--
and then I had 4 or 5 more on the desk that I used daily. And to think
it all started with a walkie talkie when I was about ten!

I think I left out a few antennas in my list too! In fact I know I left out
all my bad experiences with those stupid (I'm still poed) fiberglass
antennas. I tried out 2 of those and they were worthless--I was
really upset when all the antenna companies quit making the
aluminum type. That is when I tried the fiberglass types
and was so disappointed in their performance vs. the
Penetrator 500--of course I hadn't expected them to perform
as well, but I thought that they should work at least as well as a
"Droopy Drawers" or a Radio Shack 1/4 or 1/2 wave and when
they didn't I was desperate for a good antenna. That was about
the time I bought a Wilson Lazer Beam antenna and stuck it on
a Ham II rotor.

Probably Forest Lawn, that was 30 years ago and he was in his 60s then. Shouldn't be hard to come up with though. It was just an oscillator and a mixer that converted the VFO freq in the rx to the tx freq. His was tube but a solidstate one should be easy enough to build. Probably could just copy the tx oscillator and the rx mixer circuits from the radio to make one. As a matter fact I am fairly sure this is what he did.

Another option for getting decent freq stability on old radios is to use a more modern CB and tap off the oscilator in it to feed an old tube rig. This is one of the last things I did to my homebrewed tx. My dad gave me a RS piece of junk CB for my birthday, 23 channel. It never got put on the air. I just used it to get all 23 channels on my tube rig.

1851. Base Antenna mounting-Help Needed!

Newsgroup: rec.radio.cb
Date: 2000-02-21 00:00:00 UTC
From: StateOfTheArtCB@webtv.net
Message-ID: <2180-38B18C45-46@storefull-138.iap.bryant.webtv.net>
Source record: 24470

I am looking to mount a Solarcon I Max 2000 base antenna (24' long),
on a telescoping mast...., up the side of my house, bracketed at the
highest point.
I have a ranch-style house, and unfortunately-- the highest point is
approx 18'.
I have no other options for mounting, as the landlord won't let me put a
big tripod on the roof, and the I Max (I think) is too heavy for the
chimney, for the height I would like to go.
The problem I am having is: I don't think a 40' telescoping mast will
hold the antenna very well. That is the height I would like to go.
I will be using ALL Rohn products for this install-- from the ground
stake, to the telescoping mast, to the house bracket.
I know for sure that Rohn products are far better than Radio Shack,
and I hope this will work, What do you think??

Never said power mikes were evil, they like everthing else are abused. and yes I do agree that FM has some advantages.
People maliciously tweak every adjustment on their radio now. Do you think it would be any different when they went to FM. If the radios and operating practices were not abused like you seem to think will happen if we go to FM there would be no problem or overcrowding on the local bands and the need for for FM would be a moot point. Of course this is no fun at all for the average CBer. If you couldn't have a shot at having the badest signal on the air whats the point.

When you say limiter I take it you mean deviation limiter in the TX. Don't you think this will be the first thing that is misadjusted or removed just like modulation limiting is removed on AM and SSB now. I don't under stand why you think radios with this mode of operation will be anymore immune to hacking than present radios.

Also consider the phenomenom of "capture effect" in FM. If this will not inspire people to use excessively high power I don't know what will.

1853. Re: Hustler Penetrator 500

Newsgroup: rec.radio.cb
Date: 2000-02-21 00:00:00 UTC
From: tim960@aol.com
Message-ID: <20000221144657.01137.00000085@ng-fb1.aol.com>
Source record: 24472

>The one I had said "Golden Penetrator" on the package, is there any
>difference? It was also manufactured by Hy Gain.

The Golden Penetrator was a HyGain Penetrator 500 with a gold color anodized coating on the aluminum. The coating faded out to nothing on the one I saw, it had been stored NIB for 23+ years. The antenna itself works the same and is better (true gain and bleedover control) than any fiberglass type antenna. The Maco V5/8 is a pretty good substitute. It is broad banded for 10/11 m and is well built.

This IS some REAL NEWS. I just got back from Cleveland where I am from, and have found out some shocking news. 2 stores that basically did car stereos and other things since the 50's or before BOTH went out of business within the last 2 months. One of the places the guys just got old & the new cars were comming with what they were installing (alarms). The other place fixed car stereos FOR the CAR DEALERS (and the public). What happened (what I heard, which is probably true) is that GM had this place buy THOUSANDS of $$$$ in equipment to fix their hi-tech car stereos. And trained their techs too. They had them fix them a few years, and then they "pulled the rug out from under them," causing them to go out of business. I hear that this is a common practice of GE and GM, and possibly others. What I hear that GM wants to do is GO COMMUNIST by just having only 3 places nationally to fix their car stereos / tape players, and eliminate the family run places that do it in EACH BIG CITY that have been doing it for years! HAS anyone else seen this in your area? Dave

operation will be anymore immune to
> hacking than present radios.
> Also consider the phenomenom of "capture effect" in FM. If this
will not
> inspire people to use excessively high power I don't know what
will.

I think this based on the technical aspect and past experience.
For one thing, if you do hack the fm deviation limiter in an
effort to be "louder" it won't work. You will just drop out of the
passband of the rcvr and won't be able to talk. And, so far I
haven't seen or heard anyone who's hacked the fm deviation limiter
for the expressed purpose of screwing with someone. You cant get
that broad with the internal adjustment anyway. There's not enough
range to it.
They are using excessively high power now to gain "capture
effect" on AM anyway. I would rather hear a decent high power fm
signal that a closer station can get over than a
shitty,scratchy,garbled over modulated AM signal anyday.
At the very least the high power FM guys won't be tearing up the
remainder of the band as badly.

1872. ?Another Antenna Question?

Newsgroup: rec.radio.cb
Date: 2000-02-22 00:00:00 UTC
From: Endless, Nameless <nirtourettesvana@my-deja.com>
Message-ID: <88sjjb$su8$1@nnrp1.deja.com>
Source record: 24491

Well, I have no other options but to try and hide something for an antenna somewhere outside my house. I have tried a temporary setup with an Antron but, somehow, someone saw it and reported me to the covenant nazis in my neighborhood. So, before I sell all of my stuff and stay on the computer all the time, I would like to try something else. First, could I run some kind of wire, all around the eeves of my roof then into a center insulator down to an antenna tuner? How would this get out and could I run any power to it? Second, what kind of tuner should I get? If I choose to run an amp it will be one of those small Palomar 225s so should I get one that can handle 300 watts or more (I am assuming more)? Lastly, what kind of wire should I use for this setup? I guess I am taking the Ham radio approach by using a random length wire but hey, it works for them. And this is CB, we're allowed to experiment, right? Oh well, Thanks to all that reply!!

Forrest Adolf Gore is a communist money taking, boring, lifeless Bill Clinton wanna be. I take it that you are equally as in love with the uni-bomber, seeing as Gore's buddy Ted shares all the same views politically.

Only union-loving, socialistic, welfare bum, democrat dingleberries would vote for that knucklehead. Even a retard could see that Bradley is a better choice just for the shear fact that he is honest and an honorable man.

At least we can thank Gore for the internet.

Thanks Al!

>amps with this same name? 110 or 220 Volt,WARC?
>
As I remember, the Pride DX 300 had a 4CX250B tube, about 500-600 peak watts on good meter. Had about 6 volt filament and 2200 or so volt transformer. I think 10-40 meters, maybe 80 meters. Good low driver amp to drive larger amp like a 2 tube 3-500Z or larger amp.

It is a VHF (150 - 174 MHz) or UHF (450 - 470 MHz) FM power amplifier made to be used with 1 - 5 watt FM portable 2-way radios. I believe the power output will be somewhere between 20 and 40 watts, depending on the drive power and the frequency band. I can't recall whether the model indicates the unit is for VHF or UHF.

TACTEC (Totally Advanced Communications TEChnology) was a family of FM 2-way radios manufactured by RCA in the late 1970s and early 1980s. You might try the rec.radio.amateur.boatanchors newsgroup or a 2-way radio dealer that has been in business for a while for more details.

Not really familiar with this amp but unless your radio has a really crappy front end that needs all the help it can get pre amps are pretty worthless. I havent seen any that make a significant improvement in the signal to noise ratio of the rx. It would not be a terrible thing to wire the T/R relay to bypass the preamp.

Last time I looked, the Starduster was a 1/2 wave antenna and there was a small run of a 5/8 wave version. The PDL II was and still is a great small beam antenna with good rejection for a unit it's size. My experience with them tells me that when you put a corner to some body.....they all but vanish!

I wouldn`t hesitate at that $250.00 "h" card price.
I don`t need another system or I would bite.
That`s a pretty good deal.
I`ve been watching those "h" cards alone go for $325.00.
Of course,I`d be happy to pay $200.00 for the system with the "h" card !!!!
I`ll buy "h" cards if anyone wants to sell.

No difference in specs or performance, but I believe these are quite rare.
That gold plating nearly doubled the cost of the antenna. As a result,
relatively few were sold.

When all the decent radios exhibit capture effect why would you choose the bottom of the barrel non standard radios as a reference of what would happen if CB went to FM.
Capture effect is normally considered one of the benifits of using FM and this is true unless you have some adolescent mike keyer running 10KW just so everybody can only hear him.

we are talking about CB right? those are the typical radios used on 11.

When my daughter was two years old, she had a very strange voice, like
the child in "The Shining". I taught her to say "redrum" on a
visual cue - it "freaked out" my wife.

No, that is not exactly what we were talking about. We were dicussing the merits of using FM on CB as opposed to AM. Assuming the FCC made such a change there is no reason to think this poor quality would be the standard. .Should the change be made there is reason to expect a decent quality detector in the radios as it is both cheap and easy to implement in an FM only radio.
The typical radios used on CB are AM and a lot are fairly decent although there are some cheap ones too but the bad ones are not the standard. Why would you expect the cheap radios to be standard if we went to FM?
The imports may be the standard for now because they are illegal for use on CB FM. I would expect a legal version to be much better should it ever be allowed.

On the other hand I don't really know first hand if the capture effect on these radios is as bad as you say. I will take you word for it though. The only one I have is a Uniden and it is pretty good.

>

And I got news for you...When you tie the two together you lose the
flexability an independant RIT gives you. The whole purpose of an RIT
is to be able to shift the receive freq. independant of the transmit
freq.. That is why more expensive Amateur transceivers either come with
seperate RIT and XIT capablity, or RIT only. The proper procedure is
to set the transmit frequency with the VFO, then use the RIT to fine
tune the received signal (if necessary). Otherwise you'll be chasing
each other trying to tune one another in.

I have noticed a sweeping interference that swept through every channel of the 40 CB channels in my area since 6 months ago. The interference pattern is fairly unique that it repeats all the time and it attacks channel after channel including channel 9.

Well, it doesn't really bother me much because it is not very loud. But from the pattern I can tell someone is deliberately doing it. I am located in the San Francisco Bay Area. Anyone in this region noticing this too?

I got more news for you. You CAN'T set the transmit frequency
accurately with the use of the TX VFO. This radio is not frequency
stabile enough to count on the readout. Therefore you would
perceive yourself, by the use of the readout, as being on frequency,
but every one else will hear you off frequency.

There is a solution. That solution is to tie the RXandTX. What this
does for you is it gives you a fool proof way of getting on frequency
with any transmission. All you do is use your receiver to tune in and
automatically, no matter if your radio drifts or not, your Tx is on
frequency. After all, it's using the same foot print as your
reciever.The exact frequency does not matter. Being on
frequency is what really counts.

What you want is something like a device called "The Night Logger". They used to be available at scanner dealers. It turned on a tape recorder when there was audio present on the speaker line. Another device is called a noise gate. It too could be modified to do what you want. Check out this web site:

Design tips:
Use a capacitor (in your case it is a DC blocker)
Feed the audio (from the cap) into a diode (to rectify it)
feed the rectified audio into a comparator.
feed the other comparator input with a pot (to vary dc bias -- change your
trigger threshold)
feed the output of the comparator to a transistor (to act as a switch)

bob's your uncle. piece of cake.

I still have the maverick 250 box for sale.It's in mint condition and has a keying relay in it to drive a bigger box instead of using a foot pedal for a big box.This box can do 150-200 bird or more and 600 peak watts or more,depending on your system is set up.It takes one watt to drive it.I'm asking$350.00 and you pay the shipping,I'll take care of the insurance.Thank you for reading my message.Please email me if you are interested.The box is ready for shipping.
PS:I do not sell JUNK!

1944. Best 10m mobile antenna?

Newsgroup: rec.radio.cb
Date: 2000-02-22 00:00:00 UTC
From: Max Donoghue <mdonoghue3@home.com>
Message-ID: <38B32044.3B510F3F@home.com>
Source record: 24613

I just picked up an Eagle Sidewinder 400 for the upcoming dx season and was wondering what the best 10m antenna is based on personal experience. Excluding 1/4 wave whips. I'm driving an Intrepid (99) and would prefer something in a trunk lip style.

You can figure most all alternator draw 7 amps when fully under load, unless
you are "full fielding" them, in which case, they will draw near 10 amps

Interestingly enough, do the math, and most of the advertised "dual
alternator" regulators are nothing more than 10 amp field regulators...
Designed for the higher field current bigger alternators!

Funny...

A friend of mine has a 29Ltd.ST he wants to sell me but I keep hearing bad things about this rig. I put it on my Dosy an it had a dead key of 5 1/2 and swings to 20, it TX's at a steady 14 w/ a power mic. People I've talked to on this rig allsay it sounds great, loud and clear, but thats on my A99. The data plate on the back says date of mfg. 1997, is the older model better than the newer ones ? This rig does not have weather on it , would that make a difference ? Any info would great, thank you Joe

How do you think ARRL got strong. Because of its numbers and has a pretty good lobby effort. If the cb'ers ever got together, with money of course, probably be able to afford to get a good lobby effort. Now we have to rely on the worthless ARRL to dictate 11 meters so they can get all the freq's for themselves. Personally, I thing the cb band should be 26.500 to 27.500. Leave a little gap between us and the ham bands. I'll give it 10 more years and all the hams will have is HF anyway. To many businesses want the other freq's and we all know money talks and bullshit walks in washington. Until the freq's change for the cb, I'll freeband.

You do a lot better with a Pi-L for low pass filter funtions than you do with the more typical (read that as one less coil, so it is cheaper) Pi circuit.

So Tim are you saying that companys like Cobra are not a
manufacturing company anymore, and that the Cobra is no longer
American but Chinese or Malaysian or at least the components are
manufactured there or are they assembled in the USA?

Which ever way you look at it even if they are manufactured or
built in Asia , when it comes to me wanting to import the
product I would still have to deal with the American company
surley? If you know any different I would sure appreciate a
reply.

As I stated earlier I have asked
manufacturers/distributers/retailer or for that matter any one
else connected to the industry to throw in their two cents
worth, sadly they have been less than forthcoming--dunno why
though!!!!!!!!!!

Here in the UK where we are still restricted to 4 watt FM rigs, and until fairly recently we were not allowed to use antenna with more than I think it was one db gain. Also the length of the antenna was not allowed to exceed 39 inches. Well if you wanted to transmit any real distance these restrictions were a real pain in the butt.

Okay when you have all stopped laughing I will carry on.

Anyhow the regulations have now changed and vertical antenna up to 21 feet in length are allowed. I am currently using an Antron 99 with a gain of 9.9 db. Does this mean that the four watts I put in the bottom of the antenna is now forty watts when it leaves the top. Also does this mean that any signal I receive is amplified 9.9 times when it reaches my rig?
